App Knit
Agency

Hello!

I see you are looking for help to build an MVP for an educational app designed to help students improve their knowledge through structured content and progress tracking.

Now, your project reminds me of another educational product app that we are currently working on, named ‘SwishSense’, where the client wanted to make basketball education and learning fun and accessible for kids across the US. The app allows users to register and learn basketball through an interactive interface, while giving them bite-sized lessons and feedback through simple multiple-choice quizzes. The app also has a leaderboard that brings out the competitive juices for kids of various grades and allows users/their coaches/parents to track and monitor the learning progress over time through interactive and visual dashboards.

For this product, we built the frontend using Flutter, with a Node.js backend and MongoDB database. We also developed a web-based admin panel using React.js for content and user management, and integrated subscriptions using RevenueCat.

We have completed development of this product, and it is currently pending final App Store approval. It should be live on both the App Store and the Play Store in the coming weeks. In the meantime, you can review the product flow and user experience through the designs and testing app below:

Design:
https://www.figma.com/proto/MNRa1vNhdcc6bq8YtRVQoB/SwishSense_App-Knit?node-id=13591-125163&t=dbACbpqozNL5mVse-0&scaling=scale-down&content-scaling=fixed&starting-point-node-id=13591%3A125163&show-proto-sidebar=1

App:
iOS - https://i.diawi.com/WbmBUU
Android - https://i.diawi.com/HYxSKE

Hence, we have the experience of working closely with clients and helping them design and build educational products that help users improve their knowledge through structured content and progress tracking. So, I believe we can leverage this experience to help you build a dedicated educational product tailored to your vision.

Now, just to address the questions that you have asked separately:

1.) Your rough estimate: timeline + fixed price for the MVP features listed above
- Based on the scope you have shared and our experience with similar platforms. I believe that 2-3 months is a very reasonable timeline, and an MVP can easily be developed in that timeframe. Also, I believe that the estimated cost for the MVP development will be between USD 6,000 and USD 10,000. But I will be able to give you better estimates of the timeline and cost once we have our initial discussion.

2.) Which state management you prefer for this kind of app and why
- For this kind of application, I would recommend using Riverpod. It provides a clean and scalable way to manage state, especially for apps with multiple layers like authentication, content loading, progress tracking, and offline data handling. It also works well with dependency injection and keeps the codebase organised, which is important for long-term maintainability as you add more features in future phases.

3.) When you can start and average weekly hours you can dedicate
- Now, I am Founder and CEO of App Knit, an app development company. I have a team of 40 people working on projects end-to-end, so availability and weekly commitment are never a challenge for us. We can easily start within the next 1–2 weeks and dedicate 10–20 hours per week, or more if needed. We are flexible and can allocate the right resources based on your project's timeline and priorities. Just let us know when you are ready to move forward, and we will get started right away.

As the next step, it would be great to connect for a 30-40 minute discussion to understand your vision and discuss the project requirements and workflow in some more detail, so that we can submit a firm proposal with the timeline and cost, and help you in the best possible way.

Let me know what date and time will work best for you, and we can connect accordingly.

Looking forward to hearing from you.

Regards
Sumit Bedi

GBot
Agency

Hi, I'm a Computer Science PhD college professor turned Flutter team founder in Turkey. Me and my team are a great fit for your education app project because education is literally my domain, and we specialize in building scalable Flutter and Firebase MVPs.

I also have a strong personal connection to Germany. My brother is a cardiologist in Dusseldorf, very close to where you are! We previously built a complex IoT Flutter app called FYTA for a German client, you may have seen them in Höhle der Löwen. I understand the high standards for clean architecture and UI/UX expected in your market.

I see you need a solid foundation with offline support, Firebase integration, and a specific tech stack for this MVP. Here is my direct response to your requirements:

Link to 1 to 2 Flutter education/learning/productivity apps

Since I am a professor, education and productivity apps are very close to my heart.
Change2go: An AI powered learning and change management app we released for a client in Switzerland. It tracks user progress and delivers structured content.
https://apps.apple.com/ch/app/change2go/id1531867866?l=en-GB
Wellnow: A complex productivity and booking marketplace. It shows our ability to handle complex dashboards, user authentication, and real time databases. https://wellnowapp.com/
We also built a Flutter Web application for managing applications to Trinity College London music exams, but have not released it, yet.

Rough estimate for timeline and fixed price

For the MVP features you listed including Firebase auth, offline support, progress tracking, and responsive UI implementation across phones and tablets, my estimate is $10,000. We can deliver a highly polished, store ready MVP in 6 to 8 weeks, divided into 4 clear milestones.

Preferred state management and why

Riverpod. I strongly prefer Riverpod and I teach it at the university level. It offers compile time safety, makes dependency injection incredibly easy, and handles asynchronous data states beautifully. This is crucial for your offline support requirement. Riverpod makes it very

straightforward to cache local data using Hive or Drift and sync it with Firebase when the user comes back online.

When we can start and average weekly hours

We can start immediately. Since I employ a team of 7 developers, we can easily dedicate 30 to 40 hours a week to your project. I will personally architect the app, set up the Riverpod state management, and write the complex Firebase offline sync logic. My team will accelerate the UI building and unit testing, allowing us to move much faster than a solo developer while maintaining perfect code quality.

More info about me and my qualifications:

I am one of the earliest Flutter developers around. I served as a GDE (Google Developer Expert) between 2019 and 2025 in Flutter and Dart, which means I am an expert Flutter developer certified by Google. You can see my GDE profile here: https://developers.google.com/profile/u/gazialankus

I teach Flutter and Firebase at a university. I am the first professor in the world to teach Flutter at a university. My current employees are my past students, and we get along great and code the trickiest parts ourselves.

I lived in the US for 7 years as a graduate student and I was a summer intern at Google Irvine, which is when I met Dart before it was released. I got my Ph.D. in Computer Science from Washington University in St. Louis. I also teach in English here in Turkey, which helps keep my English fluent for our voice calls.

I was also contracted by a consortium in Turkey that included the government and Google Turkey to create a 22 hour course to teach Flutter: https://skillshop.exceedlms.com/student/collection/785394-develop-app-flutter

Please find many other projects in the attached portfolio, one being for a huge pharmacy chain in Saudi Arabia ($7B+ revenue), another being for Motorola Wearables.

I would be happy to hop on a call to discuss the architecture of your education app and how we can set up a solid foundation for your future AI and subscription features.

Best,

Gazihan

NexusLink Services
Agency

Hello there,
Hope you are doing great!

I came across your project for building a cross-platform education app and it aligns very well with the type of mobile platforms we build at NexusLink Services. We specialize in developing scalable Flutter applications with clean architecture, strong UI/UX, and solid Firebase integration — exactly what you're looking for in this MVP phase.

About Us – NexusLink Services
NexusLink Services is a software development agency with experienced Flutter, React Native, and full-stack engineers. We have helped startups and growing companies build production-ready mobile apps with clean architecture so they can scale easily in later phases.

We particularly like that you are focusing on code quality, architecture, and a solid foundation rather than just a quick MVP. That is exactly how we approach projects as well.

Recently we have developed the similar concept app for one of our US client where we have integrated the similar features.
https://www.figma.com/design/CaiJpaNzfNLPlyp50qFN2q/JenLMS?node-id=0-1&p=f

Our general mobile app portfolio: https://portfolio.nexuslinkservices.com/mobile-apps

Rough MVP Estimate based on your description:
Timeline: 8 – 10 weeks
Estimated Effort: ~350 – 420 hours

Availability: We can start immediately and dedicate 20–30 hours per week to your project.

We prefer Riverpod for this kind of app.
Riverpod provides clean architecture, built-in dependency injection, and better performance because widgets only rebuild when needed. It also makes Firebase integration, offline caching, and testing much easier, which is important for scalable apps like an education platform with progress tracking and multiple data sources.

We can start immediately after project confirmation. Our team can dedicate up to 40 hours per week to this project, ensuring consistent progress and timely delivery of milestones.

Looking forward to discussing your project and helping you build a polished education platform.

Best regards,
Nilesh Dhorajiya

https://www.upwork.com/freelancers/~019501365653b8c998

Tab 4

Hi There,

I specialize in **Flutter-based mobile applications with structured architectures, Firebase integrations, and polished UI/UX**, particularly for platforms that rely on structured content, user progress tracking, and interactive learning flows.

I understand that your goal is to build a **solid MVP for a cross-platform education app** that provides learners with structured lessons, progress tracking, and a modern, intuitive experience. Since this is the **foundation phase**, the most important factors are **clean architecture, scalable data structure, and maintainable code**, so the app can easily evolve with features like quizzes, subscriptions, and AI integrations later.

I recently worked on a **content-driven mobile application where users accessed structured learning material and tracked their progress across modules.** The project required **Firebase integration, offline data storage, responsive UI layouts, and performance optimization**, ensuring the app worked smoothly across devices and network conditions.

Availability
Start: Immediately
Availability: 30-40 hours per week

Portfolio:- https://www.teqtop.com/portfolio#mobileapplications

My FLUTTER Work:

AKADEMUS- AI - https://www.akademus.ai/
CARI APP : (Flutter) - FOOD DELIVERY
https://play.google.com/store/apps/details?id=get.cari.bestfooddelivery.app&hl=en_IN
WAYCALI (Flutter) - TAXI / RIDE
https://play.google.com/store/apps/details?id=com.multibrains.taxi.passenger.waycalicolombia&hl=en_IN
ASOS (Flutter) - Fashion / Shopping
https://play.google.com/store/apps/details?id=com.asos.app&hl=en_IN

Looking forward to helping you build a **clean, scalable learning platform with Flutter.**

Best regards,
Hitesh

Flutter based similar education mobile app samples:
1) Vedantu:
-- https://www.vedantu.com/
-- https://play.google.com/store/apps/details?id=com.vedantu.app
-- https://apps.apple.com/us/app/vedantu-learning-app/id1481959104

2) Unacademy:
-- https://unacademy.com/
-- https://play.google.com/store/apps/details?id=com.unacademyapp
-- https://apps.apple.com/in/app/unacademy-learner-app/id1342565069

Brief about me:
Shivani kumari here, an experienced Flutter developer with over 07 years of building cross-platform mobile apps for iOS and Android, including educational and productivity apps with structured learning content, dashboards, progress tracking, and offline support. I have successfully published multiple Flutter apps on both App Store and Play Store, integrating Firebase services for authentication, storage, analytics, and push notifications. I would love to partner with you to build your MVP educational app that is clean, scalable, and future-ready.

>>- I went through your requirement & understand that you want to build a mobile app for students and learners that helps them improve knowledge through structured lessons, tracking progress, and interactive learning. Users can sign up via email or social login, explore courses, view lessons with rich content (text, images, videos), track their learning progress, and access previously downloaded content offline. The app will have a clean, modern design, work seamlessly across phones and tablets, support notifications, and provide settings for theme, language, and notifications. The MVP will lay a solid foundation to add quizzes, AI assistance, bookmarks, subscriptions, and an admin panel in the future.

Technical approach as per you rmentioned requirement:
✦Flutter 3.x with Dart for cross-platform compatibility.
✦State Management: I recommend Bloc (Business Logic Component) for this project.
-- Why Bloc: It separates UI from business logic, making the app highly scalable, maintainable, and testable. It ensures predictable state changes and simplifies complex workflows like

dashboard updates, progress tracking, and offline data synchronization. Bloc is widely used in production-level apps and aligns perfectly with your requirement for clean, modular architecture.
✦Architecture: Clean and modular with proper dependency injection for maintainability.
✦Firebase Integration: Authentication, Firestore/Realtime DB, Storage, Push Notifications (FCM), and Analytics.
✦Offline Support: Cache previously viewed or downloaded lessons using Hive or Sqflite.
✦UI/UX: Modern Material 3 / Cupertino design, responsive layouts, animations, micro-interactions, and tablet optimization.
✦Testing: Unit and widget tests covering at least 30–40% of core functionality.
✦App Store & Play Store Deployment: Includes splash screens, icons, permissions, and all publishing requirements.

Estimated Effort for MVP:
Based on the listed features, the ballpark MVP will take approximately 5-6 weeks.

📌To provide an accurate final timeline and fixed bid):
■ Do you already have Figma designs or wireframes ready for all screens, or will the design also be created by me?
■ For lesson content, do you plan to provide videos and text initially, or will the content creation also be part of development?
■ Will the offline content include full videos, or only text/images? This affects storage and caching strategy.

✨ Once I receive your answers to the above queries, I can provide a detailed milestone plan with timeline, deliverables, and fixed-price estimate. This will ensure we are aligned and can start development immediately. **Ready to start immediatley**, **dedicate 40 hours per week**

I would love to help bring your education app MVP to life and create a foundation for a future-ready learning platform.

Best regards,
Shivani kumari

P.S. If you want we can hop on a quick **Zoom Meeting** to discuss this in more detail and **answer any question you may have**. Please let me know if that would be helpful for you.

https://www.upwork.com/freelancers/~010dfc9d116c67adc7

Tab 6

Hi,

Your post caught my eye because I built something similar last year. Arrive (https://arrive.school/) is a school platform I built in Flutter for Dubai, real-time sync, push notifications, role-based flows for parents and staff. And ListAIse (https://www.listaise.com/) is a side project where I worked through offline-first sync with Firebase, which sounds like exactly the challenge with your lesson caching.

The way I'd structure this: get the core right first (auth, course browsing, progress tracking, offline lessons) on architecture that won't fight you when Phase 2 hits. Here's a rough timeline:

1. Week 1: Discovery + core setup (auth, navigation, Firestore schema). Done = working login flow on TestFlight
2. Week 2-3: Home dashboard + course listing + lesson screens. Done = browsable content with progress tracking
3. Week 4-5: Offline support + push notifications + settings. Done = full MVP feature-complete
4. Week 6: Polish, responsive tablet layouts, store submission. Done = live on both stores

For state management I'd go with Riverpod. I ran it for 3.5 years at Zing Data (enterprise analytics platform) and never had to rearchitect once, even as the feature set grew significantly. That stability matters when you're planning quizzes, subscriptions, and AI down the line.

I can start this week, 30 hrs/week dedicated. Thinking 6-8 weeks for the full MVP scope.

Want to hop on a 15-minute call to walk through your requirements, or should I send a detailed scope doc first?

Raza

https://www.upwork.com/freelancers/razankv13

Tab 7

Hey, similar experience as recently developed such application in edutech domain called easy admission focused on student education and help them choosing the colleges as well as give them direction i.e.
-> Easy Admission (Android) - https://play.google.com/store/apps/details?id=com.easy.admission,
-> Apple Store(iOS) - https://apps.apple.com/in/app/easy-admission/id6740584752

Apart from that, we have recently developed edutech sites like https://preexams.ai/, https://easyadmission.ai/, https://www.shivsangamit.com/ etc. through this I have strong in this domain. Because of this experience, I am very familiar with education apps that include structured content, course flows, student dashboards, and progress tracking, which is very similar to what you are planning for this MVP.

For a project like this, I would build the application using Flutter with a clean architecture approach so that the codebase remains scalable when you introduce Phase 2 features later.

My preferred setup for this kind of app would be:
-> State management: Riverpod (very scalable and test-friendly)
-> Architecture: Clean Architecture with clear separation of presentation, domain, and data layers
-> Backend services: Firebase (Auth, Firestore, Storage, FCM, Analytics)
-> Offline storage: Hive for caching downloaded lesson content
-> Dependency injection: Using Riverpod providers for modular structure

This structure works very well for apps that need offline access, structured course content, and scalable feature expansion.

Based on given details, I believe this features to be there:
Based on your description, the first version would include:
• Secure authentication (Email, Google, Apple)
• Simple onboarding flow
• Home dashboard showing progress and recommended lessons
• Course and subject browsing with card/grid UI
• Lesson screens with rich text and image support
• Progress tracking per course and lesson completion
• Offline caching for downloaded lessons
• Push notifications via Firebase Cloud Messaging
• Responsive UI that works well on phones and tablets
• Settings screen with language, notifications, and theme options

I also appreciate that you mentioned clean code, tests, and GitHub workflow, which is exactly how we usually work. Regular updates every few days with short demos or Loom videos are perfectly fine for me.

For such projects my rough estimate for MVP
1) Timeline: 7–9 weeks for a polished MVP
2) Weekly availability: 20–30 hours/week
3) Start: Immediately after project confirmation

We can divide the project into 4–5 milestones, for example:
-> Project setup + authentication + onboarding
-> Course listing + lesson screens
-> Progress tracking + offline support
-> Notifications + settings + UI polishing
-> Testing, optimization, and store preparation

I have few questions to ask for more detailed understanding:
1) Will the lesson content come from Firebase directly, or do you plan to manage it through a separate CMS/admin panel later?
2) For offline content, should the entire lesson be downloaded, or only specific resources like text and images?
3) Do you already have Figma designs, or should we start with a UI system based on Material 3 guidelines?
4) Do you have any reference for this?

Once I review the designs or wireframes, I can also suggest small UX improvements that usually help learning apps feel smoother and more engaging. Overall, this looks like a well-thought-out MVP, and I would be happy to help build a clean, scalable Flutter app that you can continue expanding in future phases.

Looking forward to hearing more about the project.

Regards,
Vandana
Flutter Developer

https://www.upwork.com/freelancers/~01d5da2741b73f8bc0

Tab 8

🚀 Flutter Expert for Scalable Education Apps | Clean Architecture | Firebase Specialist

Hello,

Your project immediately caught my attention because education apps require the perfect balance of performance, engaging UX, and scalable architecture—which is exactly the type of Flutter applications I specialize in building.

I'm a Flutter developer with 4+ years of experience creating production-ready mobile apps for iOS and Android, including apps with structured content, progress tracking, Firebase backends, and polished UI/UX. I focus on writing clean, maintainable code so MVPs can scale smoothly as new features are added.

Why I'm a strong fit for your project

• Flutter & Cross-Platform Expertise: 4+ years building high-performance Flutter apps
• Firebase Experience: Auth, Firestore, Storage, FCM, Analytics
• Clean Architecture: Feature-based architecture using BLoC or Riverpod
• Offline Support: Implemented caching with Hive / local storage in production apps
• UI/UX Focus: Smooth animations, responsive layouts for phones & tablets
• App Store & Play Store Deployment: Experience shipping and maintaining live apps

Preferred architecture

For this kind of product I typically use Clean Architecture with BLoC because it keeps business logic separated from UI, makes the app easier to test, and allows future features (quiz system, subscriptions, AI features) to be added without major refactoring.

Rough MVP Estimate

Timeline: ~8–10 weeks
Milestones: 4–5 milestones covering authentication, onboarding, dashboard, courses/lessons, offline support, notifications, and final polish.

Availability

I can start immediately and dedicate 40+ hours per week over the next few months.

I also prioritize regular updates every few days with screenshots or short Loom walkthroughs, so you always know the project progress.

If you'd like, I'd be happy to review your Figma designs or user stories and suggest the best architecture and timeline for the MVP.

Looking forward to collaborating and building a clean, engaging learning platform for your users.

Best regards,
Chetan Vaghela
Flutter Developer

https://www.upwork.com/freelancers/~01e9a8b68b190538e1

Tab 9

Cover letter
$15.00/hr
Proposed rate
English

Many education apps fail in the MVP stage because the foundation isn't structured properly, messy state management, weak Firebase integration, and poor offline handling make it difficult to scale later. If the architecture isn't clean from the start, adding features like quizzes, subscriptions, or AI later becomes painful and expensive.

I would build the app using a well-organized clean architecture with clear separation between UI, business logic, and data layers. For state management I usually prefer Riverpod because it keeps dependencies predictable and testable while staying lightweight for MVPs. Firebase would handle authentication, Firestore data structure, storage, and push notifications while ensuring the app remains scalable. For offline support, Hive or sqflite can cache lesson content so users can continue learning without connectivity.

My Work:
https://apps.apple.com/pk/app/memrise-speak-a-new-language/id635966718

https://apps.apple.com/pk/app/joos-business/id6466819276

https://apps.apple.com/pk/app/safemeet/id6747867722

https://play.google.com/store/apps/details?id=com.petbae.app

https://play.google.com/store/apps/details?id=com.reviero.app

The onboarding, dashboard, course listings, lesson screens, and progress tracking will be structured in a way that future features like quizzes, bookmarks, and subscriptions can plug in easily without refactoring the core code. I also focus heavily on smooth UI, responsive layouts for phones and tablets, and preparing the app properly for App Store and Play Store submission.

Do you already have the lesson content structure planned in Firebase (courses → modules → lessons), or should that data model be designed as part of the MVP?

For offline lessons, should the user manually download course content or should the app automatically cache recently opened lessons?

If the scope for the MVP is finalized, I can also provide a realistic timeline and milestone breakdown for development.

Looking forward to discussing the project.

Best,
Hasan

https://www.upwork.com/freelancers/~01a7162a0db55f1fd4

Language

Hey there! Riverpod's my go-to for this kind of app. Clean separation between UI and business logic, and it plays nicely with Firebase without the boilerplate overhead you'd get with BLoC. Easier for someone else to pick up later too, which matters when you're building an MVP foundation meant to grow.

For the offline support, I'd use Hive. Fast reads, no setup friction, and it fits the lesson caching pattern you described without overcomplicating things.

I built QuranTalk a few years back, content-driven app with FCM, Firestore, auth, and daily engagement tracking. That architecture is basically what you're describing here. More recently I shipped Calcount, a MyFitnessPal-style app with Firebase and RevenueCat, delivered the core product in under 4 weeks. Both on the App Store and Play Store.

The main thing I'd focus on first is your auth flow and data structure in Firestore. Getting that right early saves a lot of pain when progress tracking and offline sync come in later.

I can start this week and commit 20-25 hours a week. Quick call if you want to talk through the milestone breakdown before we kick things off.

Hi there,

Your project immediately caught my attention — building a clean, scalable education app with a strong foundation is exactly the kind of work I enjoy.

I'm a Flutter developer with 3+ years of experience building cross-platform apps for both Android and iOS, including apps with structured content, user progress tracking, and Firebase-backed systems. I focus heavily on clean architecture, performance, and delivering a polished user experience that feels modern and intuitive.

Why I'm a strong fit for your project

Experience building content-driven and scalable apps (MVP → production)

Strong with Flutter + Firebase (Auth, Firestore, FCM, Analytics)

Clean, maintainable architecture using Riverpod / BLoC (depending on project needs)

Focus on UI/UX quality, responsiveness, and smooth animations

Comfortable working with GitHub, milestones, and regular update cycles

How I'll approach your MVP

I'll build your app with a future-ready structure so Phase 2 features (quizzes, subscriptions, AI, etc.) can be added without rewriting the core.

Core implementation plan:

Authentication: Email/password + Google/Apple sign-in via Firebase Auth

Onboarding flow: Clean, minimal, engaging screens

Dashboard: Dynamic home with progress, recommendations, and stats

Courses & Lessons: Scalable structure with rich content support (text, images, future video-ready)

Progress tracking: Efficient tracking using Firestore/local cache

Offline support: Hive or sqflite for downloaded lessons

Push notifications: Firebase Cloud Messaging integration

Settings: Theme, language, notifications

UI/UX: Material 3 + Cupertino where needed, fully responsive across phones & tablets

Technical approach

State Management: I recommend Riverpod for this project — it provides scalability, testability, and clean dependency management without boilerplate overhead.

Architecture: Feature-based clean architecture with clear separation of concerns

Testing: Unit & widget tests for core logic (targeting ~30–40% coverage)

Code quality: Well-structured, documented, and production-ready

Timeline & Availability

Estimated timeline (MVP): 6–8 weeks

Availability: 20–30 hours/week

Start: Immediately

Estimated Budget

MVP Fixed Price: $5,000 – $6,500 (can be split into 4–5 milestones as you prefer)

Relevant Experience

I've worked on multiple Flutter apps involving:

User authentication systems

Real-time data syncing

Content-based platforms

Clean UI implementations with strong performance focus

(I can share specific app links and walkthroughs during our discussion.)

I appreciate your emphasis on clean code, communication, and long-term scalability — that aligns perfectly with how I work. I'll make sure you get not just a working MVP, but a solid product foundation ready to grow.

Let's connect and go over your requirements, Figma designs, and milestones in detail.

Best regards,
Rashid Ali
Flutter Developer

Hello,

Your project caught my attention because I currently work on large-scale education mobile applications used by thousands of students. The focus on structured learning content, progress tracking, and scalable architecture is very similar to the systems I've helped build and maintain.

I have strong experience with Flutter, Firebase integrations (Auth, Firestore, Analytics, FCM), and building clean, maintainable architectures using BLoC or similar state management patterns.

For an MVP like this, my typical approach is to first establish a solid app structure and core flows (authentication, onboarding, dashboard, course navigation, and progress tracking). This makes it much easier to expand features like quizzes, subscriptions, and AI-based learning tools later.

I'm also comfortable working with GitHub-based workflows and iterative milestone delivery.

If helpful, I'd be happy to review your requirements and suggest a practical development roadmap for Phase 1 of the MVP.

Best regards,
Wisnu

Hello , I'm an expert flutter engineer with more than 5 years experience ,I'm confident that I would be a great fit for this role.I have worked actually on a language learning app where users have exercices to complete , role plays to play (speech to text and text to speech , text correction and much more) but it is still not published yet . I've helped several startups turn their ideas into top-notch products,one of which successfully raised $120K through Techstars. I've also worked with well-established companies in Germany on projects that have achieved over 50,000 downloads. here are some of my live apps :
https://apps.apple.com/de/app/start7-der-handball-manager/id6443919324
https://apps.apple.com/us/app/habit-tracker-vita/id6752308462
https://apps.apple.com/us/app/organize-share-links-lynkr/id6751778075
https://apps.apple.com/us/app/anxiety-relief-calm-seryn/id6755425114

I can deliever for you the phase 1 of the product with the best code quality and within a month , the price depends on the design and some other factors but I can say for now :
I can start as soon as possible and I can provide 20-30 hours per week
phase 1 : 3-4 weeks , : 2k $
phase 2 : 2-3 weeks : 1.5k $

for the state managment I will use Bloc or Cubit

https://www.upwork.com/freelancers/~0164706c6720f551b3

Tab 14

Dear Sir/Madam,

My name is Anh Tran - a Senior Mobile and AI Engineer with 6 years of experience in mobile app development, backend systems, and AI integration. I recently came across your job posting and found it aligns well with my skill set and interests.

Throughout my career, I've worked on various mobile applications and systems that require robust performance, clean architecture, and seamless user experiences. My expertise spans not only mobile development (iOS and Android) but also backend development and AI-driven features.

You can find more details about my technical background and contributions here:
- GitHub: https://github.com/tsnAnh
- Stack Overflow: https://stackoverflow.com/users/12485825/anh-tran

Some of the notable apps I've contributed to include:
- PhotoPlate: https://apps.apple.com/us/app/photoplate/id6743801629
- Keep Technologies: https://apps.apple.com/us/app/keep-technologies/id1591955434
- Retsy Chat: https://apps.apple.com/us/app/retsy-chat/id1576942355
- tagSpace: https://apps.apple.com/us/app/tagspace/id1256307378
- Ultorex: https://play.google.com/store/apps/details?id=com.ultorexapp.io
- Majestic Woman: https://play.google.com/store/apps/details?id=app.findme.com

I take pride in delivering high-quality, scalable, and maintainable applications. I'm especially passionate about integrating AI to enhance functionality and user experience.
If you believe my background is a good fit, I'd be happy to discuss how I can contribute to your team. Looking forward to your response.

Sincerely,
Anh Tran

EXPERT FLUTTER DEVELOPER WITH 12+ YEARS OF EXPERIENCE
Hi, I have read your project description and it’s clear that you’re looking for a developer who can build a solid MVP for an education app while keeping the architecture clean and scalable for future features.

That approach is absolutely the right one for learning platforms.

Based on your description, the core focus of this MVP will be:

• User authentication (Email + Google + Apple)
• Onboarding flow
• Dashboard showing learning progress and recommended lessons
• Course and subject listing
• Lesson detail screens with rich content
• Progress tracking
• Offline support for downloaded lessons
• Push notifications using Firebase Cloud Messaging
• Clean UI using Material 3 / Cupertino components

This kind of architecture needs to be designed properly from day one so that adding quizzes, subscriptions, AI explanations, and admin panels later becomes straightforward.

Our team has been building mobile applications for more than 12 years, including cross-platform apps built using Flutter with scalable backends.

For this type of learning platform, we typically implement:

• Flutter 3.x with clean architecture
• State management using Bloc or Riverpod
• Firebase integration (Auth, Firestore, Storage, FCM)
• Offline storage using Hive or sqflite
• Modular structure so new features can be added without rewriting core components

We also make sure the app is fully prepared for App Store and Play Store submission, including permissions, icons, splash screens, and performance optimization.

Here are some mobile applications we have developed.

Traveluro:
iOS: https://apps.apple.com/us/app/traveluro-hotel-booking/id1663172926
Android: https://play.google.com/store/apps/details?id=com.traveluro&hl=en_US&pli=1

Vendcell:
iOS: https://apps.apple.com/us/app/vendcell/id6677036994
Android: https://play.google.com/store/apps/details/Vendcell?id=com.vendcell&hl=en_IN

ERUIT:
iPhone App: https://apps.apple.com/il/app/eruit/id1438203471

A couple of quick answers to your questions:

State management preference
For an application like this, we usually prefer Bloc architecture because it keeps business logic separated from UI, which makes the app easier to scale and maintain as new features like quizzes and subscriptions are added.

Availability
We can start immediately and dedicate 40 hours per week to the project.

If possible, I would love to review the wireframes or Figma designs so I can provide a more accurate timeline and fixed estimate for the MVP phase.

Looking forward to hearing from you.

Thanks
Priyesh
https://www.upwork.com/freelancers/~01df43c6221b06de04

Hi, Your project description is very clear and well structured, and it sounds like a great MVP to build a strong foundation for a learning platform.

I'm a Flutter developer with experience building production mobile applications from scratch and publishing them on both the Apple App Store and Google Play. One of the main apps I built is Trip Ticket, a travel marketplace platform where users browse trips, view details, and book directly through the app. Because of this project, I have strong experience building scalable Flutter architectures, handling API integrations, and designing structured user flows.

For an app like this education platform, I would typically use Riverpod for state management because it provides clean dependency management, strong scalability for larger apps, and makes testing business logic easier compared to simpler approaches.

My relevant experience includes:
• Flutter (production apps for iOS & Android)
• Firebase integrations (Auth, Firestore, FCM)
• REST API integration and scalable architecture
• Responsive UI development across multiple screen sizes
• App Store & Google Play deployment
• GitHub workflow for collaborative development

Regarding the MVP scope you described, the features such as authentication, onboarding, course browsing, progress tracking, offline support, and push notifications are all very standard Flutter patterns and can be implemented with a clean modular architecture so Phase 2 features can be added smoothly later.

Availability
• I can start immediately
• Available ~20 hours per week
• Comfortable working with GitHub and providing regular progress updates

Once I review the full requirements or Figma designs, I can provide a more precise timeline and milestone breakdown for the MVP.

Looking forward to learning more about the platform and helping build a polished learning experience.

Best regards,
Ahmed

Hallo, Wie geht's.

Ich bin Shah Wali, a Flutter developer with 3+ years of experience building scalable, high-performance apps for startups and enterprise clients. While I haven't built an education app before, my work on large-scale apps like "JazzCash" (50M+ downloads) and productivity tools has given me deep expertise in the core features you're looking for — like authentication, offline support, and Firebase integration. I'd love to bring that experience to your education app's MVP.

Why I'm a Good Fit for Your Project
- Proven Flutter & Firebase Expertise:
- Worked at JazzCash, a fintech app with 50M+ downloads, using Flutter 3.x and Firebase (Auth, Firestore, FCM). This project required robust authentication, real-time updates, and offline data persistence (using Hive).
- Delivered a productivity app, from idea to launch, with a clean UI/UX (Material 3), responsive layouts, and a settings screen with dark/light mode toggles—directly aligning with your MVP requirements.
- Used Riverpod for state management in a SaaS dashboard app, ensuring clean architecture and easy scalability for future features like quizzes or subscriptions.
- I've also contributed to an education app similar to the one below.
https://apps.apple.com/us/app/ccrn-exam-prep-pass-2026-test/id6444069473

- MVP Focus & Clean Code:
I specialize in building lean MVPs that balance speed with scalability. For example, I delivered a task management app's MVP in 4 weeks, structuring the codebase to support future AI integrations and admin panels. My code includes 30–40% test coverage and thorough documentation.

- UI/UX & Performance:
I've implemented Material 3 designs for apps used by 100k+ users, optimizing performance (e.g., reducing load times by 40% in a recent project). If you share Figma designs, I can match them precisely while ensuring smooth animations and micro-interactions.

Technical Approach for Your App
- State Management: I'd use Riverpod for its simplicity and scalability, especially for managing authentication states and user progress tracking. It pairs well with clean architecture for easy future expansions (like adding quizzes or AI features).

- Firebase Integration: I'll set up Auth, Firestore, and FCM from the start, ensuring a solid foundation for analytics and notifications.
- Offline Support: I'll implement Hive for cached lessons, ensuring users can access content without connectivity.

Timeline & Availability
- MVP Estimate: 4-5 weeks (depending on design complexity), with 3–4 milestones (e.g., authentication + onboarding, core UI, Firebase integration, testing). My fixed-price estimate for the MVP is $2000.
- Availability: I can start right away and dedicate 20–25 hours/week.

I'm particularly excited about the opportunity to build a foundation that supports future AI integrations (like chatbots for explanations) and responsive layouts for tablets. If you're open to a quick call, I'd love to discuss your vision for the app's growth and how we can align the architecture accordingly.

We can have a 20 mins free consultation. Looking forward to your thoughts!

Some of my work,
https://play.google.com/store/apps/details?id=com.techlogix.mobilinkcustomer&hl=en
https://apps.apple.com/us/app/giftlo-ai-gift-planner/id6751743785
https://www.youtube.com/@shahwali_k -- my YT where I've posted videos on Flutter, Firebase & FCM and got combined views in Lacs.
https://x.com/shahwali_k

Best regards,
Shah Wali K.
https://www.upwork.com/freelancers/shahwali

Tab 18

Cover letter

Proposed rate
English
Language

I am available for technical interviews and can start right away. I'd like to understand a bit more about how the learning journey should work for students inside the app. Like will the platform primarily guide users through structured course paths, or should it also adapt recommendations based on progress and engagement? Understanding the learning flow early helps design the data structure, progress tracking, and content delivery in a way that keeps the system scalable for future features like quizzes, AI explanations, or subscription tiers.

I've worked on many cross platform Flutter applications where the goal was to build scalable mobile platforms with dashboards, structured content, and strong user engagement. Some of the apps I've worked on include:

https://apps.apple.com/us/app/myfood-global/id6755030425
https://apps.apple.com/us/app/buzz-express/id6749039397
https://play.google.com/store/apps/details?id=com.jjs.deliveries_food
https://play.google.com/store/apps/details?id=com.user.pikup
https://play.google.com/store/apps/details?id=com.dcodax.riderem_customer

I've also contributed to mobile products involving dashboards, content systems, and community driven experiences such as:

https://apps.apple.com/us/app/get-out-there-uae/id1624915432
https://apps.apple.com/us/app/f1-race-programme-2024/id6478093369
https://apps.apple.com/ae/app/wecares/id6739131482
https://play.google.com/store/apps/details?id=com.fimm.freshbox)

Projects like these involved designing clean mobile architectures, integrating Firebase services; authentication, database, storage, and push notifications, implementing structured content systems, and ensuring responsive layouts that perform well on both phones and tablets.

For an education MVP like this, I would structure the platform around learner profiles, course modules, lesson content, and progress tracking. Flutter will handle the UI layer while Firebase manages authentication, data storage, analytics, and push notifications. This keeps the system lightweight for the MVP while ensuring it can easily expand later to include quizzes, AI learning assistance, or subscription features.

For state management in this type of application, I typically prefer Riverpod because it provides a clean separation between UI and business logic, improves scalability, and makes testing easier as the application grows.

A few quick questions that would help clarify the scope:

Will course content be stored directly in Firebase or managed through a separate admin panel or CMS?
Should offline support allow downloading full lessons or only caching previously viewed content?
Will the course structure follow a hierarchy such as Course → Module → Lesson?
Do you already have Figma designs prepared, or should the UI follow a provided design direction?

Based on the scope described, the MVP would typically take 7–8 weeks to complete with a well-structured architecture. I can dedicate 30–40 hours per week during the development phase and start immediately.

Hi! I have built apps in the healthcare and education-tech space that have raised over $400K in the past year and to start answering your questions:
- Here is my portfolio of apps I have built in the education space:
Worlds of Hello - a US-based speech therapy platform built with Flutter that uses speech recognition to assist caregivers with the clients whilst also providing real-time chat with their clients (https://worldsofhello.com)
HBCU Horizon - an educational and mentorship platform that provides support and access to events and mentors for students at HBCUs (https://hbcuhorizon.org)
- It would take me 2 months to 2 and half months to complete the project, so about 8 to 10 weeks with a budget of US$4 500, and with an availability of 25 hours per week from whenever the project starts.
- I use BLoC for state management as it easier and simpler to build and scale as each BLoC focuses on a singular task or operation instead of managing state in a monolith design. It is also easier to use with dependency injection as you can abstract the underlying technology a BLoC uses and easily change functionality under the hood without having to change the BLoC itself.

A question I have for you is I have a lot of experience with Rive, an animation engine that allows for smooth and performant animations to be used in Flutter, are you also looking for an educational and interactive experience similar to that of Duolingo, and how would like your recommendation system for content to look like?

If you like my experience and knowledge please do reach out and we can have a chat about your project and hopefully work together

Thanks!

- Donell

https://www.upwork.com/freelancers/~01191f880e120bc067

Tab 20

Apart from response to the 4 questions. I've attached the full workflow diagram and stack architecture diagram for reference: they show the complete user journey from first launch through lesson completion, offline access, and push notifications, with every feature mapped to its technology layer.

Here's my response to your four application questions:
1. Flutter app portfolio links
All of the following are live Flutter apps I've built and published on both stores:
Rash Decision — Flutter + Firebase + in-app purchase packages
Android: https://play.google.com/store/apps/details?id=com.rash.decision.app
Image upload, Firebase backend, push notifications, and tiered in-app purchase — directly mirrors your Firebase, offline, and premium content requirements.

Goodjob Dominicana — Flutter, two-sided marketplace
iOS: https://apps.apple.com/us/app/goodjob-profesionales/id1661938925
Android: https://play.google.com/store/apps/details?id=com.enemoscada.goodjob
Complex user flows, structured content categories, smooth cross-platform UI across phone and tablet.

Aldhea — Flutter + Firebase, social platform
iOS: https://apps.apple.com/us/app/aldhea/id6443562221
Android: https://play.google.com/store/apps/details?id=com.enemoscada.inclusib
Firebase auth, data privacy safeguards, rich UX on both platforms.

2. Timeline and budget
Based on the full MVP scope, I estimate 10-12 weeks across four milestones:

Milestone 1 (Weeks 1–3): Firebase Auth, email/password + Google + Apple sign-in, onboarding flow, settings screen with theme and notification preferences.

Milestone 2 (Weeks 3–6): Course catalog with categories and cards, lesson pages with rich content (formatted text, images, embedded media), responsive layout for phone and tablet.

Milestone 3 (Weeks 6–9): Per-user progress tracking, dynamic dashboard with stats and recommendations, offline access via Hive local caching with Firestore sync on reconnect.

Milestone 4 (Weeks 9–12): FCM push notifications, Firebase Analytics + Crashlytics, automated tests for core logic, UI polish, and full App Store + Play Store submission.

Budget: $5760 - milestone-based payments align well with how you've structured the engagement.

3. State management approach and why

I use Riverpod with a Repository pattern for Flutter projects of this scope. Riverpod keeps the UI completely decoupled from business logic and data sources — which matters here because you have Firebase, a local Hive cache for offline, and a future AI layer all potentially feeding the same screens. With Riverpod providers, extending or swapping a data source doesn't touch the widget layer at all. The Repository pattern means your post-MVP features, quizzes, bookmarks, subscriptions, AI assistance — slot in as clean additions rather than refactors. It's also highly testable, which supports the automated testing requirement in your brief. I've used this combination across multiple production apps and it holds up as complexity grows.

4. Availability and weekly hours

Available to start immediately. I can dedicate 40 hours per week consistently throughout the project. I'm in IST (GMT+5:30), comfortable with async communication, and happy to provide regular milestone demos and progress screenshots as you've described.

Happy to jump on a short call before we start to confirm scope and align on the first milestone.

Hemil Gandhi....

Byteztech Private Limited
Agency

TOP-Rated Senior Flutter Mobile App Developer, 7+ years of experience

Hi, Your education app concept and MVP scope are very clear, and I'd be happy to help build a clean, scalable Flutter application that can grow with future features like quizzes, AI explanations, and subscriptions.

For this type of application, I would structure the solution with Flutter 3 (latest stable) using a clean architecture approach and Riverpod or BLoC for state management. Firebase would handle authentication, database, storage, analytics, and push notifications. The app would include onboarding, a dashboard showing learning progress, a course catalog with lesson pages, offline content support, and a settings section with themes, notifications, and language options. The architecture will be modular so future features such as quizzes, bookmarks, subscriptions, and AI tutoring can be added easily in later phases.

For the MVP, the development would typically be structured into milestones such as authentication & onboarding, course/lesson system, progress tracking, offline content handling, and push notifications. The final result would be a well-organized Flutter codebase integrated with Firebase, ready for App Store and Google Play submission, along with proper documentation and testing for core logic.

Live Flutter Mobile Apps I've Built

Loop Planet
iOS:- https://apps.apple.com/in/app/loopplanet/id6453764243

Seaqua Beauty APP
Android:- https://play.google.com/store/apps/details?id=com.seaqua
iOS:- https://apps.apple.com/us/app/seaqua-cosmetics/id6470202511

DayTrax App:
Android:- https://play.google.com/store/apps/details?id=com.daytrax.app

In terms of timeline, the MVP can realistically be completed in 8–10 weeks, depending on final design details and content readiness, with regular progress updates through GitHub commits and short demo videos.

I’m available to dedicate 15–30 hours per week during the development period and collaborate through milestone-based delivery as described.

Looking forward to discussing the project further and reviewing the designs or wireframes when available.
https://www.upwork.com/freelancers/~01e8fedba64ccbb133

Tab 22

Hello,

I’m reaching out to discuss your education app project. With 8 years of Flutter experience and over 40 published apps, including education-focused apps with Firebase and offline support, I’m ready to build a clean, scalable MVP that prioritizes maintainability and future growth.

I'd prefer a Provider for State Management:
The provider is ideal for MVPs, balancing simplicity with scalability—no boilerplate overload—while supporting scoped state and efficient rebuilds. It’s lightweight, integrates smoothly with Flutter’s widget tree, and avoids over-engineering for early-stage projects.

Your requirements align with my expertise:
Firebase: I’ve built apps with Auth, Firestore, and FCM, such as an app with real-time notifications and secure login.
RevenueCat: I’ve implemented in-app purchases, handling subscriptions and entitlements seamlessly.
UI/UX: My apps use Material 3/Cupertino widgets and responsive layouts, with a focus on performance and micro-interactions.

Check my latest Live app:
https://apps.apple.com/us/app/deckmate-cruise-hub-chat/id6754904162
https://apps.apple.com/us/app/flexie-shifts/id6478423897
https://apps.apple.com/us/app/faroz-kitchen/id1455483835
https://apps.apple.com/us/app/botch-app/id6746935636

To finalize the timeline and cost for the MVP, could you share the Figma designs, user stories, or wireframes? This will help me assess the complexity of features like offline support and push notifications.

I’m available to start immediately and can provide daily updates via Loom or GitHub. Let’s discuss how we can make this app a foundation for future growth.

Looking forward to your feedback!

Best,
Tasvir L.

Hello, is it possible for you to share sample course structure and lesson content? I've developed Flutter apps with similar structured content and learning flows. One example is WagerFlo, a learning platform where users access structured lessons, track their progress, and interact with educational content through a clean and engaging interface.
- WagerFlo: https://apps.apple.com/in/app/wagerflo-learning-app/id6749749465

2) Another is The Divine Bible, which focuses on structured content delivery with organized chapters, smooth reading experience, and user progress tracking.
The Divine Bible: https://apps.apple.com/us/app/the-divine-bible/id1662497445

For the MVP scope you described, the estimated timeline would be around 7–9 weeks, with a rough budget of $7k–$10k depending on final scope and UI complexity. For state management, I prefer Riverpod because it offers better scalability, testability, and clean dependency management compared to traditional approaches like Provider.

I'm available to start immediately and can dedicate 30–40 hours per week to ensure steady progress and regular updates throughout development.

I'd be glad to discuss your project goals and share insights on how we can efficiently build your MVP. Let's connect to outline the next steps.
Please check out my portfolio here:
https://drive.google.com/file/d/1Q3Sk7UV9EJcGh7Cl7mION0tVGqU4dpiJ/view

Warm regards,
Chirag

Many education apps struggle after launch because the MVP isn't built with scalability and structured learning architecture in mind. When the foundation is clean, features like quizzes, AI tutoring, and subscriptions can be added later without rebuilding the product.
From your document, the goal is a Flutter-based learning app MVP with structured lessons, progress tracking, offline support, and Firebase integration, designed to deliver an engaging learning experience while staying flexible for future expansion.

Relevant experience includes:
• Rhithm – Student engagement platform supporting 5M+ users, delivering analytics, progress tracking, and evidence-based learning activities.
https://rhithm.app
• Clackamas Community College – Digital education platform transformation, including an online learning system and improved student content delivery.
https://www.clackamas.edu
• Holos Mobile App – Cross-platform mobile application with progress analytics and structured user journeys.
https://apps.apple.com/us/app/holos-your-wellness-journey/id1442657269

How We'll Bring Your MVP to Life
• Review requirements, user stories, and design references to define a clean Flutter architecture built for long-term scalability.
• Implement authentication, lesson modules, progress tracking, and offline content while integrating Firebase services such as Auth, Firestore, Storage, and push notifications.
• Develop a polished, responsive UI aligned with your Figma or design references to ensure a smooth learning experience across phones and tablets.
• Prepare the application for production with testing, performance optimization, and configuration for both App Store and Play Store submission.
Our team has experience building education platforms and scalable mobile learning products designed to support large user bases while maintaining strong performance and usability.

After an initial conversation to review the detailed requirements and designs, we'll provide a clear development roadmap with an accurate timeline and milestone-based estimate for the MVP phase.

One quick question: Will lesson content be managed directly in Firebase initially, or do you plan to connect a CMS or admin panel in Phase 2?

Best regards,
Mehak

Hello, I am Henok, a Senior Flutter developer with over 6 years of experience who builds production-ready mobile applications with clean architecture, scalable code, and polished UI/UX. I have strong experience developing cross-platform apps with Flutter and Firebase, focusing on performance, maintainability, and a smooth user experience.

For this project I would use Flutter 3 with Clean Architecture and BLoC for state management. BLoC works very well for larger applications because it separates business logic from UI, keeps state predictable, and makes the app easier to maintain and test as the project grows.

I have built several Flutter apps involving structured content, dashboards, and Firebase integrations.

Quiz Apps:

https://play.google.com/store/apps/details?id=com.BinaryAbyssinia.EthioQuizStudyG9to12&hl=en
https://play.google.com/store/apps/details?id=com.addismatric.addismatric

other live apps I've worked on:

• JiJi (marketplace app with more than 1M+ downloads)
Play Store: https://play.google.com/store/apps/details?id=et.jiji.app&hl=en
App Store: https://apps.apple.com/us/app/jiji-ethiopia/id1525181998

• SantimPay
Play Store: https://play.google.com/store/apps/details?hl=en&id=com.wallet.santimpay
App Store: https://apps.apple.com/us/app/santimpay-so-simple/id6446675815

• ABa Mobile Banking for Amhara Bank
Play Store:
https://play.google.com/store/apps/details?hl=en&id=com.amharabank.Aba_mobile_banking
App Store: https://apps.apple.com/in/app/aba-mobile-banking/id6450265710

Timeline & Estimate
MVP timeline: 6–8 weeks
Estimated fixed price: $7,000 – $9,000 depending on final scope and designs.

Availability
I can start immediately and dedicate 20–30 hours per week.

Let’s have a quick meeting to discuss the requirements and roadmap. I would be happy to help build a strong foundation for your learning platform.
https://www.upwork.com/freelancers/~015ce12be08f7b72bb

Hi there,

I am a Senior Flutter Developer and, more importantly, a professional educator with extensive experience in building large-scale EdTech solutions. I am currently a key developer for MEBİ, the official mobile education platform for the Ministry of National Education in Turkey, which is live on both the App Store and Google Play.

Why I am the ideal expert for your Education App:

EdTech Specialist: Being a teacher myself, I don't just write code; I understand the pedagogy behind structured content, progress tracking, and student engagement.

Proven Track Record: I have successfully developed and published multiple educational and productivity apps (including MEBİ, Ders Yolum, and VitaLoop) on both Stores. I handle the entire submission, icon, and permission process professionally.

Technical Excellence: I am an expert in Provider and Bloc for state management, ensuring a clean, scalable architecture. I have deep experience with Firebase (Auth, Firestore, FCM) and Offline Support (Hive/Sqflite), which are core to your MVP.

High-Quality UI/UX: I prioritize Material 3 and responsive layouts, ensuring the app feels native and polished on both phones and tablets.

I work with clean code principles, provide regular updates via screenshots/Loom, and am very comfortable working with GitHub private repos. I am ready to dedicate 20-30 hours per week to make this project a success.

https://play.google.com/store/apps/details?id=tr.gov.eba.mebi

Hi,
I've built and shipped Flutter apps for iOS + Android with Firebase, clean architecture, offline support, and store-ready releases - exactly the kind of scalable MVP foundation you're aiming for.

Relevant apps I've built (live on stores):
Glimpsee
https://play.google.com/store/apps/details?id=com.skyhighbrands.glimpseee
https://apps.apple.com/lv/app/glimpseee-unfiltered-moments/id6633437870

Kangaroo Valley Festival
https://play.google.com/store/apps/details?id=com.kangaroovalleyfolkfestival.kangaroovalleyfolkfestival
https://apps.apple.com/au/app/kangaroo-valley-folk-festival/id6736466611

Approach for your MVP:
- Clean, modular architecture (ready for Phase 2)
- Firebase (Auth, Firestore, FCM, Analytics)
- Offline-ready lessons
- Smooth, modern UI
- Store-ready delivery (iOS + Android)

State management:
I recommend Riverpod - scalable, testable, and clean for long-term growth.

Estimate:
Timeline: 7-9 weeks
Effort: 160-200 hours
Cost: ~$3,500 - $4,400 (at $22/hr)

I can start immediately and dedicate 20-30 hrs/week, with regular updates via GitHub and Loom as you prefer.
Would you like me to first map the Firebase schema + content structure before we begin development?

Thanks,
Shreya

Tibicle LLP - Your Trusted Tech Partner for AI/ML, Web, Mobile, Desktop, Cloud & Custom Software Solutions
Agency

"OOPS," "eNalanda," "Pickademy" are some of the Flutter applications I’ve built and published for both Android and iOS, which aligns well with your requirement of building a cross-platform education MVP app with clean architecture and scalable foundation. I'm Uttam, with 10+ years of experience in mobile app development and 8+ years of expertise in Flutter, Node.js, and Firebase. I’ve successfully delivered cross-platform apps with seamless performance, clean UI, and scalable architecture, approved and live on both the App Store and Google Play Store.

Here are a few relevant projects I’ve worked on:
OOPS
OOPS is an online learning platform like Udemy, offering free and paid courses in technology, business, arts, and personal development. Created by industry experts, it features interactive video lectures, quizzes, and assignments for an engaging experience. Students can learn at their own pace while earning certificates and building valuable skills.
https://play.google.com/store/apps/details?id=oops.study.app&pcampaignid=web_share

eNalanda
Educational gaming app created with Flutter Flame engine featuring three games: Chemistry, Biology, and Physics. In Chemistry, players collect Protons, Neutrons, and Electrons to build elements. The Biology game involves dragging and dropping cell components to create plant and animal cells. In Physics, users build electric circuits to learn about components.
https://play.google.com/store/apps/details?id=com.gaming.app.gaming_app_dev

Pickademy
Pickademy is an AI-powered global education search platform that helps students discover the right universities, colleges, and courses worldwide. It uses semantic AI and personalized recommendations to simplify higher education decisions. The platform focuses on clarity, career outcomes, and student-first guidance.
https://test.pickademy.ai/

Note: **While I am new to Upwork as a full-time freelancer**, **I have spent the last 8+ years building enterprise-grade mobile applications for startups and companies**, **focusing on scalable architecture**, **secure API integrations**, **and high-performance mobile apps**.

Timeline and Budget can be finalized after detailed scope discussion.

State Management: I prefer Bloc, as it keeps business logic separate and makes the app scalable and easy to maintain
Availability: Can start immediately, available 40 hours/week

I can build a clean, scalable, and user-friendly education app with smooth UI, proper progress tracking, and full Firebase integration, ready for both App Store and Play Store launch.

Looking forward to your response.

Best regards,
Uttam

Hi there,

I went through your requirement carefully, and this is exactly the kind of structured, long-term Flutter product I prefer working on where the focus is not just features, but building a clean, scalable learning system from day one.

Instead of a typical proposal, here's how I see your app:

This is not just an education app.
It's a content delivery + habit-building system where UX, performance, and structure matter more than feature count.

What I bring to this project

Flutter (5+ years) | Production apps shipped | Firebase-heavy systems

Relevant apps (built / major contribution):

Joyscore (wellness + guided user journeys)
https://joyscore.com
https://apps.apple.com/in/app/joyscore-health-selfcare-tool/id1449005255
https://play.google.com/store/apps/details?id=com.joyscore&hl=en_IN

Allen Digital (large-scale learning platform)
https://play.google.com/store/apps/details?id=digital.allen.study

GymeDiary (structured program & tracking app)
https://play.google.com/store/apps/details?id=com.gymediary.ksd

These involved user progress tracking, structured content flows, and engagement systems, which directly aligns with your app.

Tech decisions (clear & practical)

• State Management: Riverpod (clean, scalable, testable)
• Backend: Firebase (Auth, Firestore, FCM, Analytics)

• Offline: Hive (fast + simple caching for lessons)
• Architecture: Clean Architecture (feature-based modules)

Timeline & Estimate (realistic MVP)

• Timeline: ~8-12 weeks
• Budget: $7k - $10k (depending on UI polish + offline depth)

A few important questions (these impact architecture)

Should lessons support full offline mode (media included) or text-only caching for MVP?
Will content be managed via Firebase directly or external CMS later?
Do you want progress synced in real-time across devices?
Any plan for multi-language support in V1, or later phase?
Should we design keeping future AI features (chat/explanations) in mind from day one?

Availability

• Start: Immediate
• 25-35 hrs/week
• Comfortable with regular updates (every 3-5 days + Loom walkthroughs)

If helpful, I can also propose a milestone plan that lets you launch a usable version in 6 weeks, then iterate instead of waiting full cycle.

Best,
Jatinder Kapila
Flutter Developer
https://www.upwork.com/freelancers/jatinderkapila

Below is the demo of a similar **education/learning app** I've developed (iOS + Android):

https://www.loom.com/share/4d9701854be944f3b709b4c0c9fdf64f

The app offers the following features:
-> User authentication
-> Admin creates lessons and quizzes (title, description, videos, questions, etc)
-> Admin creates coordinator roles
-> Coordinator assigns lessons and quizzes to the caregiver (mobileapp user)
-> Progress tracking of lessons
-> Caregivers can only see their assigned lessons
-> Quiz with scoring
-> Data export (CSV format)
-> Multi-lingual Support for Caregivers

Here’s the milestone breakdown of the project based on cost and timeline:

First milestone: UI/UX designs of the app
Cost: $600
Timeline: 2 weeks

Second milestone: Front-end development of the app
Cost: $1300
Timeline: 2 weeks

Third milestone: Backend development
Cost: $2700
Timeline: 6 weeks

Fourth milestone: Deployment
Cost: $400

Timeline: 2 weeks

Quick note: the above breakdown is an estimate based on the job post. Once we review the details together, we can lock in an accurate cost and timeline.

Looking forward to chatting and discussing more about it to make sure we are on the same page.

Which state management would I use?
Ans: I would use BLoC. Its a solid foundation for future scaling.

When you can start and average weekly hours you can dedicate
Ans: I can start from tomorrow. Average weekly hours would be around 30-40 hrs.

Hi,
I understand the concept: a modern cross-platform education app where students learn through structured courses/lessons, see progress on a clean dashboard, and can keep learning even with basic offline access. Phase 1 is an MVP, but it needs clean architecture and a strong foundation so you can add quizzes, subscriptions, and AI features later without rewriting.

I can build this in Flutter for iOS + Android with Firebase backend and production-ready code. I'm a full-stack mobile developer with 10 years of experience (strong in Flutter + Firebase) and I've shipped multiple apps with authentication, dashboards, offline-first flows, and push notifications.

How I'd build your Phase 1 MVP
• Auth: email/password + Google + Apple sign-in
• Onboarding: 3–4 screens
• Home dashboard: progress, recommended lessons, quick stats
• Course/subject listing: cards/grid + categories
• Lesson detail: rich text + images (YouTube embed ready for later)
• Progress tracking: completed lessons + % per course
• Offline support: cache downloaded lessons locally (Hive/sqflite) + sync when online
• Settings: language, notifications toggle, dark/light mode
• Push notifications: FCM setup + basic flows

Tech approach
• Flutter 3.x with clean architecture (Bloc/Riverpod) + dependency injection
• Firebase: Auth, Firestore/Realtime DB, Storage, FCM, Analytics
• Unit/widget tests for key business logic + core UI
• App Store / Play Store ready builds (icons, splash, permissions)

Working style
• 3–5 milestones with working builds each step
• Updates every 3–5 days with Loom/screenshots
• GitHub private repo with clean commits and PRs

If you share the Figma/mood board and content structure (courses → lessons → sections), I'll propose a clear milestone plan with timeline and cost.

Best thing about me is I don't just have written feedback but also video feedback from my clients. You can watch them all through the links below.

Hello There, I am top-rated Mobile app developer with an extensive experience in bring vision to reality & I am ready to start ASAP with my full-time availability of 30+ hours per week!

I read through your job description carefully, and I really like the idea behind this learning app. Building a clean, well-structured education platform that can grow beyond the MVP is exactly the kind of project I enjoy working on. With 10+ years of extensive experience building cross-platform apps using Flutter and React Native and I also work with a small experienced team of developers and designers. This allows us to handle not just development, but also UI/UX polish, backend integration, and long-term scalability, which seems important for the direction you described.

Your MVP feature list is very clear and well thought out. Everything you mentioned authentication (email + Google/Apple), onboarding flow, dashboard with progress tracking, lesson screens with rich content, offline support, and Firebase integration is very achievable within a solid Flutter architecture. We've implemented similar structures before, especially for apps that require structured content, progress tracking, and scalable feature expansion.

For this kind of application, I would recommend using Riverpod for state management. It keeps the codebase clean, scalable, and easier to maintain as the app grows. Combined with Clean Architecture and proper dependency injection, it makes adding future features like quizzes, subscriptions, or AI explanations much smoother.

Please look at some of my past solutions that I have done:
> Android:
https://play.google.com/store/apps/details?id=com.biterite.nutrition&hl=en_IN&gl=US&pli=1
> IOS : https://apps.apple.com/us/app/biterite-nutrition/id1470593904
> IOS: https://apps.apple.com/gh/app/repo/id6466786404?platform=iphone
> Android: https://play.google.com/store/apps/details?id=com.cartobikeapp
> IOS : https://apps.apple.com/us/app/cartobike/id1608618088

This is exactly the type of project where building the right foundation early makes a huge difference later. In terms of workflow, I'm very comfortable working with GitHub repositories, milestone-based delivery, and providing regular updates with screenshots or Loom videos every few days. Communication and transparency are something I always prioritize in projects.

Overall, this looks like a great project, and I'd be excited to help you build a clean, scalable MVP that can easily grow into the full learning platform you're envisioning.

Best regards,
Anik

Education MVPs fail when onboarding/auth is clunky, progress tracking feels unreliable, and offline support is bolted on late then learners churn before the habit forms. I'll build a polished Flutter iOS/Android V1 with clean architecture, Firebase wiring, and a foundation that's easy to expand into quizzes/subscriptions later.

I've shipped learning-style products with structured content, progress tracking, reporting outputs, and Firebase-backed user flows (AI Powered LMS System and My-Wordz: Learn Mandarin), where stability, UX clarity, and scalable data models mattered from day one. That maps directly to your onboarding → dashboard → lessons → progress loop, plus notifications and offline access.

For your Phase-1 MVP, I'll build Flutter 3.x with Riverpod (or Bloc, if preferred) using clean architecture + dependency injection. Features include: email/password + Google/Apple sign-in, 3–4 screen onboarding, home dashboard with progress/recommended lessons/quick stats, course/subject listing (cards/grid), lesson detail (rich text + images, YouTube-ready), progress tracking (% per course + completed lessons), offline downloads via Hive/sqflite, responsive phone/tablet layouts (Material 3/Cupertino), settings (language, notifications toggle, dark/light), Firebase Auth + Firestore/Storage + FCM + Analytics, Crashlytics, and 30–40% unit/widget test coverage for core logic. App/Play submission prep included (icons, splash, permissions).

State management: Riverpod (clean DI + testability) or Bloc (strict separation); I'll align to your preference and keep folder structure documented.

Available 15–30 hrs/week for the next 2–4 months. Rate: $15–$20/hr. MVP ballpark: 8–10 weeks depending on content/offline scope.

Share your Figma/wireframes + content structure; I'll return a milestone plan and start with a small paid trial (auth + offline lesson sample) to prove quality early.

Reference Portfolios:

AI Powered LMS System:
https://www.upwork.com/freelancers/mawaisjamil?p=1946189736504279040
My-Wordz: Learn Mandarin, Smart Language Learning App:

Hi Boss! I'm Gaurav Passi, Senior Full-Stack Developer and AI Solutions Architect with 17+ years of experience delivering production mobile applications across iOS and Android. Your project stands out because the emphasis on clean architecture, Firebase integration, offline support, and a polished learning experience maps directly to the kind of structured, well-engineered mobile work I've shipped repeatedly. What if your education app shipped with an AI agent that understands your entire codebase, so you could add new course types, adjust progress logic, and roll out Phase 2 features in plain English, without a developer on every call? That's exactly what I deliver alongside every build.

Here's relevant work I've delivered:
🔹 Woolworths SA (https://www.woolworths.co.za/) | Large-scale cross-platform app serving millions of users, featuring personalised dashboards, offline-capable content, Firebase integrations, and responsive layouts across phones and tablets
🔹 Barbr Biz (https://apps.apple.com/gb/app/barbr-biz/id1550249560) | Cross-platform Flutter app with smooth onboarding flows, clean Material UI, and full App Store and Play Store submission, delivered with 5-star Upwork feedback
🔹 Trinkerr (https://trinkerr.com/) | Feature-rich mobile app with progress dashboards, real-time data, structured content flows, and polished UI across iOS and Android

✅ Answering Your Specific Questions
State Management Preference: I prefer Riverpod for this project. It offers clean dependency injection, strong separation of concerns, and scales gracefully as features are added in Phase 2. It pairs naturally with clean architecture and keeps business logic fully testable, which directly supports your 30 to 40% test coverage requirement.

✅ Timeline and Availability:
Estimated MVP timeline: 6 to 7 weeks across 4 milestones
Available to start:- immediately
Weekly availability: 20 to 25 hours per week

✅ Proposed Milestones:
Milestone 1: Auth, onboarding, Firebase setup, folder structure and architecture foundation
Milestone 2: Home dashboard, course listing, lesson detail screen, progress tracking
Milestone 3: Offline support (Hive), push notifications (FCM), settings screen, dark/light mode
Milestone 4: UI polish, animations, test coverage, App Store and Play Store submission prep

Here's the value I bring to this project:
✅ Flutter and Firebase Expertise: Production experience with Flutter 3.x, Firebase Auth, Firestore, FCM, and Analytics, covering exactly the technical stack your MVP requires
✅ Clean Architecture and Riverpod: Structured, well-documented codebases with proper dependency injection and state management, built to make Phase 2 additions straightforward rather than painful
✅ Offline Support and Performance: Hands-on experience implementing Hive-based offline content, smooth animations, and micro-interactions that make the difference between a good app and a great one
✅ Self-Sustaining Delivery: A Forge Agent trained on your codebase ships at handover. Add quizzes, in-app purchases, and AI explanations in Phase 2 in plain English, no developer dependency
🔗 Website: https://upcoretech.com
🔗 Video Introduction: https://www.loom.com/share/52ff3b9ce19648909d1b9c18ba4968c4

You're not just getting a Flutter developer for this MVP. You're getting a senior mobile engineer who delivers a clean, scalable foundation your product can grow on, with a self-sustaining system built for the long term.

Best regards,
Gaurav

Hi,

Your project for a cross-platform mobile education app (Flutter MVP) sounds very well planned, and it aligns closely with the type of scalable applications I typically build.

I have 7+ years of professional Flutter experience building production apps for both iOS and Android, with strong expertise in Firebase integrations, scalable state management, and performance-optimized UI.

Relevant Flutter Apps I've Built

Here are a few apps where I was heavily involved in development:

• Tashwash (iOS)
https://apps.apple.com/us/app/tashwash/id1495587571
On-demand service app with booking flows, dashboards, and real-time interactions.

• Pakama Athletics (iOS)
https://apps.apple.com/us/app/pakama-athletics/id1589310227
Fitness & training platform focused on structured content and user engagement.

• Pet Market Store (Android)
https://play.google.com/store/apps/details?id=com.sprintsolutions.petmarketstoreapp&pcampaignid=web_share
E-commerce mobile application with product listings, user accounts, and scalable backend integration.

For this project I would recommend:

• State Management: Riverpod or Bloc (I prefer Riverpod for scalability and cleaner dependency injection)

The app will be built with modular architecture and reusable components, making it easy to add quizzes, AI features, subscriptions, and bookmarks in Phase 2.

Rough MVP Estimate

Based on the features described:

Timeline: 6–8 weeks
Estimated Cost: $5,000 – $7,000 (can be adjusted after final specs)

Availability

• Start Date: Immediately
• Weekly Availability: 20–30 hours
• Communication: Upwork + GitHub + Loom updates every few days

Looking forward to learning more about your project.

Best regards,
Muhammad Shahzaib
https://www.upwork.com/freelancers/~010408babfe41771dc

Hi! Hi, your education app idea sounds well structured and Flutter is a great choice for building a scalable MVP for both iOS and Android.

Before outlining the plan I have two quick questions.

- Will the course content such as lessons and images be managed directly in Firebase or are you planning a separate admin panel later to manage content?
- Do you already have the Figma designs ready or should the UI be implemented based on a reference style or mood board?

My approach would be to first set up the Flutter project with a clean architecture and proper folder structure. I would integrate Firebase services including authentication, Firestore database, storage, and push notifications.

Then I would build the onboarding flow, dashboard, course listing, and lesson screens with progress tracking and offline storage using Hive. The app would be structured so new features like quizzes, subscriptions or AI tools can be added easily later. I would also prepare the builds for both App Store and Play Store.

I have built cross platform mobile apps using Flutter with Firebase authentication, database, and push notifications.

I also have hands on experience building learning and content driven apps with structured course flows and progress tracking.

For state management I prefer Riverpod because it keeps the code clean, scalable and easier to test for growing apps.

Have a look at some of my apps on app store:
https://apps.apple.com/by/developer/muhammad-aizaz/id1628055671

Have a look at some of my apps on play store:
https://play.google.com/store/apps/developer?id=Soft+Droid+App

Here's a link to my **GitHub**:
https://github.com/muhammadaizaz22?tab=repositories

Let’s set up a time to discuss your requirements in more detail.

Best Regards,
Muhammad A.

Hi there, I recently developed The Academix, a Flutter-based cross-platform education app designed for students to access courses, attend live lectures, and track their learning progress through a structured digital platform.

The Academix: Flutter-Based Learning Platform
Key Features:
• Access course materials and lecture notes
• Join live classes via Google Meet or Zoom
• Real-time interaction with instructors and peers
• Practice tests with multiple question types
• Performance insights and progress tracking
• Attendance and course management tools

Apps:
iOS: https://apps.apple.com/us/app/the-academix/id6502640514
Android: https://play.google.com/store/apps/details?id=com.institute.theacademix

Technical Approach for Your App

• Mobile App: Flutter 3.x (single codebase for iOS + Android) with scalable architecture
• Backend: Firebase (Authentication, Firestore/Realtime DB, Storage, FCM, Analytics)
• State Management: Bloc / Riverpod for clean, maintainable architecture
• Offline Support: Local storage using Hive or SQLite with queued data and automatic sync when connectivity returns
• Admin & Content Management: Firebase console or a custom web admin panel if needed

Rough Estimate for MVP

Timeline: 8–10 weeks
Estimated Cost: $5,000 -7000$ depending on final UI scope and lesson content structure.

State Management Preference

I generally recommend Riverpod for modern Flutter apps because it provides better testability, dependency injection, and scalable architecture compared to older approaches.

Availability: I can start immediately and dedicate 30 - 40 hours per week to the project.

Best Regards,
Navratan

Hi, I'm Kamran. Flutter developer, 6 years primary, 29 apps shipped, 100% Job Success on Upwork. I've built several content-driven apps with structured lessons, progress tracking, offline caching, and Firebase backends, which is essentially what your education MVP needs.

Two relevant apps I built as sole developer:
Audio Notes (iOS + Android, live on both stores) is an AI-powered note-taking app with offline-first architecture using Hive for local storage, Firebase Auth with Google and Apple sign-in, in-app purchases on both platforms, and a clean onboarding flow. I handled everything from first commit through App Store and Play Store submission, including icons, splash screens, permissions, and CI/CD via GitHub Actions.

DNI (production SaaS, 18 months) is a structured content platform where users progress through categorized modules, each with rich content screens, progress tracking per section, and a dashboard showing completion stats. It runs on Flutter mobile and web with a Firebase backend, supports 26+ languages at runtime, push notifications via FCM, and dark/light mode theming. The architecture is a 13-package monorepo with clean separation.

For state management I'd go with Riverpod. For an education app with nested state like per-lesson progress, course completion percentages, and user preferences for language and theme, Riverpod's provider scoping keeps things clean without the boilerplate of Bloc. It also plays well with offline caching since you can layer local data sources under the same provider interface. That said, I've shipped production apps with Bloc (GETTR, 494K-line codebase), Provider, and Riverpod, so I'm flexible if you have a preference.

For the MVP scope you described, my rough estimate is 6 to 8 weeks at 20 to 25 hours per week. I'd structure it across 4 milestones: (1) project setup, auth, and onboarding, (2) home dashboard, course listing, and lesson detail screens, (3) progress tracking, offline support, and settings, (4) FCM integration, tablet responsiveness, testing, and store submission prep. I can refine this into a proper milestone breakdown once I see the Figma or wireframes.

I can start immediately, available full time and I'm comfortable with Loom updates every 3 to 5 days and working in your GitHub repo. I've worked with German clients before and the timezone overlap with Central Europe works well for async communication.

Happy to jump on a quick call to walk through the requirements and share my approach for the architecture.

Hello Sir

I'm Jayesh Italiya, a 10-year Flutter & React Native expert with a proven track record of delivering **clean, scalable, and user-centric mobile apps**. I've built over 50 cross-platform apps, including **education-focused projects** like [insert app name 1] (e-learning platform with progress tracking) and [insert app name 2] (interactive course app with Firebase integration). My work emphasizes **clean architecture**, **Firebase expertise**, and **pixel-perfect UI/UX**—exactly what your MVP requires.

Why I'm the Right Fit for Your Project:
1. **Core Features Covered**:
- **User Authentication**: Email/password + Google/Apple sign-in with Firebase Auth.
- **Onboarding & Dashboard**: Smooth 3–4-screen onboarding and a dynamic home dashboard with progress stats.
- **Course & Lesson Structure**: Rich text, images, and future YouTube embedding using Flutter's `webview_flutter`.
- **Offline Support**: Hive/sqflite for cached lessons, ensuring seamless offline access.
- **UI/UX**: Material 3/Cupertino widgets, responsive layouts, and animations for a modern feel.
- **Push Notifications**: Firebase Cloud Messaging setup for real-time updates.

2. **Technical Expertise**:
- **State Management**: I'll use **Bloc** for its scalability and separation of concerns, ensuring maintainable code for future phases.
- **Firebase Integration**: Auth, Firestore, Storage, and FCM will be implemented with best practices.
- **Code Quality**: Clean architecture, 40%+ test coverage, and GitHub workflows for version control.

3. **Timeline & Budget**:
- **Estimate**: 3 months (20 hours/week) for the MVP, with **$15,000 fixed price** (adjustable based on scope).
- **Milestones**: 3–4 phases (e.g., auth/UI, core features, testing/deployment) for transparent payments.

4. **Availability**: I can start **within 3 days** and dedicate **20+ hours/week** for the next 3–4 months.

My Approach:
- **Week 1–2**: Finalize Figma designs, set up Firebase, and implement authentication.
- **Week 3–6**: Build onboarding, dashboard, and course listing with responsive layouts.
- **Week 7–10**: Develop lesson details, progress tracking, and offline support.
- **Week 11–12**: Polish UI/UX, add push notifications, and prepare for App Store/Play Store submission.

I've worked on **education apps** (e.g., [insert app name 3]—a language-learning app with similar features) and prioritize **regular updates** via Upwork messages and Loom videos. My GitHub repo for [insert app name] is private, but I can share snippets or demo links if needed.

Let's discuss your Figma designs and requirements to refine the scope. I'm confident in delivering a **polished MVP** that's ready for expansion.

Looking forward to your response!

Best regards,
Jayesh Italiya

Hi,
I hope you're doing well.

I'm a Senior Mobile & Full Stack Developer with over 11+ years of experience building scalable mobile applications and SaaS platforms. I specialize in Flutter-based cross-platform apps, Firebase integrations, and clean architecture mobile systems, which aligns perfectly with the MVP education app you're planning to build for iOS and Android. I have experience developing learning platforms, content-based applications, and mobile products with progress tracking, dashboards, and cloud integrations. I focus on clean architecture, maintainable codebases, and scalable foundations, which is especially important for MVPs that will grow into full platforms.

What Makes Me a Good Fit:
• Strong experience in Flutter cross-platform mobile development (iOS & Android)
• Expertise with Firebase (Auth, Firestore, Storage, FCM, Analytics)
• Experience building education and learning-based mobile applications
• Strong focus on clean architecture and scalable mobile app structure
• Experience implementing offline data storage (Hive, SQLite, caching)
• Experience publishing apps on Google Play Store and Apple App Store

My Project Approach:
Architecture & Project Setup: Set up Flutter project with clean architecture, modular structure, and scalable state management (Riverpod or Bloc depending on project needs).
Core MVP Development: Implement onboarding, authentication, dashboard, course listings, lesson screens, and progress tracking.
Firebase Integration: Configure Firebase Authentication, Firestore database, Storage, and push notifications using FCM.
Offline Data Support: Implement caching for downloaded lessons using Hive or SQLite to support offline usage.
UI/UX & Performance Optimization: Build responsive layouts for phones and tablets with modern Material 3 UI and smooth interactions.
Testing & Store Preparation: Implement basic unit/widget tests, optimize performance, and prepare builds for App Store and Play Store submission.

Relevant Work Experience:
1. True Food Kitchen
- Description: Developed a Flutter-based mobile app with backend integrations, secure authentication, and scalable API communication.
- Tech Stack: Flutter
- Project Link:
https://play.google.com/store/apps/details?id=com.thanx.truefoodkitchen&hl=en_US
2. ZouKru
- Description: Built a scalable Flutter mobile application with real-time interactions and structured backend integration.
- Tech Stack: Flutter
- Project Link:
https://play.google.com/store/apps/details?id=com.dating.zoukru&pcampaignid=web_share
3. Lucid Ocens
- Description: Developed a React Native mobile app with structured API architecture and user-based data handling.
- Tech Stack: React Native
- Project Link: https://play.google.com/store/apps/details?id=com.lucid_ocean&hl=en_IN
4. Vex Fitness (Mobile App)
- Description: Cross-platform fitness app providing live and on-demand workout sessions with user progress tracking.
- Tech Stack: React Native
- Project Link: https://play.google.com/store/apps/details?id=com.vex.fitness
5. Tutosh (Mobile App)
- Description: Live tutoring and online learning platform enabling students to attend sessions and track learning progress.
- Tech Stack: Swift (iOS)
- Project Link: https://apps.apple.com/us/app/tutosh/id1593624375
6. Quippy Lab
- Description: An interactive learning platform designed to improve students' speaking skills through structured lessons and exercises.
- Tech Stack: React.js, Node.js
- Project Link: https://quippy-lab.com/

Technical Expertise:
-Frontend Development: Angular, React.js, Next.js, Tailwind CSS, Material-UI, Vue.js.
-Backend Development: Node.js, Express.js, PHP, Laravel
-E-Commerce: Shopify, Shopify Liquid, Shopify Themes, WordPress, WooCommerce
-Database: Supabase, Firebase, MongoDB, PostgreSQL, MySQL
-Mobile: Flutter, React Native, ionic,kotlin.
-Cloud & DevOps: Vercel, AWS (EC2, S3, Lambda, RDS),Kubernetes.
-Integrations: REST APIs, push notifications, third-party services

Availability:

I’m available Monday to Friday, 10:00 AM to 7:30 PM IST, and I can dedicate 20–30 hours per week to this project. I can start immediately.

Your project sounds like a great opportunity to build a well-structured education app MVP with strong scalability for future features, and I’d be excited to help bring it to life.

Best regards,
Md.Jubair

Website: https://www.classe365.com/

Hopster: ABC Games for Kids

Android: https://play.google.com/store/apps/details?id=tv.platomedia.hopster
iOS: https://apps.apple.com/app/id689165391
Website: https://www.hopster.tv/

➽ Your rough estimate: timeline + fixed price for the MVP features listed above

Answer 2: A rough estimate for this MVP education app would be around $12K-15K and approximately 10–12 weeks of development.

➽ Which state management you prefer for this kind of app and why

Answer 3: I would recommend Riverpod because it's clean, scalable, and easy to maintain, which makes adding new features and managing app state much simpler as the app grows.

➽ When you can start and average weekly hours you can dedicate

Answer 4: I can start once we finalize the details and can dedicate about 30-40 hours per week to the project.

➽ **My TOP 3 Mobile App projects**

Healthengine - Telehealth App

Android: https://play.google.com/store/apps/details?id=com.healthengine.android&hl=en

Hello, **I have reviewed your project requirements along with the Education mobile app PDF Attachment and understand your Education Mobile App Project**. **Building a Learning App with offline access**, **structured courses**, **and real progress tracking can quickly become complex if the architecture is not designed properly from the start**. **I can help you build a clean**, **scalable Flutter MVP integrated with Firebase so the app is ready for future features like quizzes**, **subscriptions**, **and AI learning assistance**. Test test test

My approach would be to build the App using Flutter with Clean Architecture and Riverpod/Bloc, **while integrating Firebase** (**Auth**, **Firestore**, **Storage**, **Messaging**, **Analytics**). **This ensures maintainability**, **smooth performance**, **and easy expansion when you introduce advanced learning features**.

🔹 **Recent Projects**:
GlobPey Wallet [Fintech]
https://play.google.com/store/apps/details?id=com.gp.globpeyapp
https://apps.apple.com/us/app/globpey-wallet/id6639617555?platform=iphone

LinksHub - Service Marketplace [In-App Purchase and Real-time Chat]
https://play.google.com/store/apps/details?id=com.LinksHub.work

Clubbable Nightclubs guest list & table booking
https://apps.apple.com/us/app/clubbable/id1037837524
https://play.google.com/store/apps/details?id=com.ai.clubr

Flowi: reporting and invoicing [In-App Purchase]
https://play.google.com/store/apps/details?id=se.htms.htmassistant
https://apps.apple.com/us/app/flowi/id1458978271

BehtarWay
https://play.google.com/store/apps/details?id=com.enrichai.behtarwayplus
https://apps.apple.com/in/app/behtar-way/id6747147076

🔹 **Questions**:
1. Will course and lesson content be managed through a CMS/admin panel, or directly through Firebase?

2. For offline access, Should users download lessons manually or should previously viewed lessons cache automatically?
3. Are UI designs/wireframes already available, or will design support be required?
4. Which features are the highest priority for the MVP release within the 2–3 month timeline?

👉 **Rough MVP Estimate**
Timeline: 8–10 weeks (2–2.5 months)
Budget: $8,000 – $12,000 depending on final scope, content structure, and offline functionality complexity.

👉 **Which state management you prefer and why**?
I prefer Riverpod because it offers clean architecture, better scalability, and easy testing. It works well for managing complex states like authentication, course data, progress tracking, and Firebase streams while keeping the codebase organized.

👉 **When can you start and weekly availability**?
I can start immediately and dedicate 40 hours per week over the next 2–4 months.

I am an Experienced Flutter Developer with 9+ years of building scalable cross-platform apps with Firebase, clean architecture, and polished UI/UX.

Let me know a good time this week to discuss the project in more detail. **I would be happy to walk through the technical approach**.

Best & Regards
Dhaval Jadav

Dear Client,

We've already worked on a few Educational Flutter apps with similar complexity (dashboards, structured content, Firebase, etc.), so your MVP scope feels very clear and doable from our side. I would first highlight some of our projects:

1. Graded+ (Education App)
iOS: https://apps.apple.com/us/app/graded-student-work-scanner/id1641870509
Android: https://play.google.com/store/apps/details?id=com.app.a1f4W000008SzlXQAS
This is closest to your use case, focused on structured workflows and a smooth user experience.

2. We also developed a school-focused mobile app (PS 456 Bronx Bears) that allows parents to track student progress, schedules, and school updates, giving us strong experience in building education-related platforms with structured data and dashboards.
iOS: https://apps.apple.com/gb/app/ps-456-bronx-bears/id1561274472

How we'd approach your app:
For this kind of learning platform, the key is building it clean and scalable from the start, so future features like quizzes, subscriptions, or AI can be added easily.
We'd typically use:
• Flutter (latest stable)
• Riverpod for state management, better for scalability, testability, and clean architecture
• Firebase (Auth, Firestore, Storage, FCM, Analytics)
• Offline support using Hive/Sqflite
• Clean, responsive UI based on your Figma

Rough estimate:
• Timeline: 320 - 350 hours
• Budget: $5,000 (based on MVP scope, can refine after designs)

Availability: We can start immediately and dedicate 30–40 hours/week.

If you'd like, we can also quickly outline the app architecture or MVP roadmap before starting.

Best Regards,
Yash Balde
Mobile App Developer

If your lessons could swipe themselves into students' brains, I'd make it happen in Flutter, want me to walk you through the MVP blueprint?

Hi, I'm Arham, a seasoned app developer with a knack for turning caffeine into code, particularly when it involves Flutter. I've got a solid track record of designing eye-candy interfaces that users love to navigate, integrating systems and APIs without breaking a sweat, and ensuring my websites feel right at home.

I specialize in building cross-platform Flutter apps focused on education and productivity, with clean architecture, scalable state management, and engaging UI/UX. I've worked on apps where structured learning, progress tracking, and interactive content were key to user engagement and retention.

For your MVP, I can develop a Flutter iOS & Android app with email/Google/Apple authentication, onboarding, dashboards, course listings, lesson detail views with rich content, basic progress tracking, offline support, and push notifications. The app will use a clean architecture (I recommend Riverpod for scalable state management), well-organized folder structure, and Firebase integration for Auth, Firestore/Storage, and FCM. It will be fully prepared for App Store and Play Store submission, with responsive layouts, modern Material 3/Cupertino design, and maintainable, testable code to allow easy feature expansion in future phases.

Here are some of my recent projects that are currently live and kicking:

bammbuu (Language learning application which uses Supabase and Subscriptions):
https://apps.apple.com/app/bammbuu/id6739758405

Twlm (Uber Eats, but for Saudi Arabia):
https://apps.apple.com/sa/app/twlm-%D8%AA%D9%88%D9%84%D9%85/id6479403521

Dawlati (Job-seeking platform exclusively for UAE nationals which uses Stripe):
https://apps.apple.com/us/app/dawlati-%D8%AF%D9%88%D9%84%D8%AA%D9%8A/id6677036478

If my work (or my slightly unhinged enthusiasm) caught your eye, let's talk; shoot me a message.

Hi,

Thanks for sharing the detailed document outlining the key features required to build the education platform MVP. App requires a well-structured Flutter architecture with user authentication, course modules, progress tracking, offline support, and Firebase integration to deliver a smooth learning experience.

Rudra Innovative Software, a mobile and full-stack development team with 16+ years of experience building education, SaaS, and AI-powered learning applications. We help startups and founders launch scalable MVP products with clean architecture so new features can be added easily later.

Our Agency profile:- https://www.upwork.com/agencies/rudrainnovative/

Relevant EdTech Experience:
Lingvist – Language learning platform with structured lessons and progress tracking.
Website: https://lingvist.com/
iOS: https://apps.apple.com/us/app/lingvist-learn-languages-fast/id969093402
Android: https://play.google.com/store/search?q=lingvist&c=apps

Kaligo – AI-powered literacy app for kids where we handled full-stack development and real-time learning progress tracking.
https://www.kaligo-apps.com
iOS: https://apps.apple.com/us/app/kaligo/id1345325412
Android: https://play.google.com/store/apps/details?id=com.learnandgo.kaligo

Mindko.com – SaaS, AI-based quiz and homework tool using **OpenAI and Next.js**.

For project, we will assign a **1 Project Manager**, **1 Sr. Flutter developer**, **2 backend developer**, **and QA engineer**, and follow an Agile development approach to ensure smooth feature delivery and regular progress updates.

Could you please share the Figma or wireframes? This will help us analyze the components and structure reusable UI elements for efficient development.

Availability: We can start immediately and dedicate 20–30 hours per week during development.

If possible, let's schedule a quick call to define the MVP architecture and milestone plan for the first release.

Best regards,
Rudra Innovative Software
Top Rated Plus | 100% Job Success

Hey. after carefully reviewing your post, I understand you're looking for a Flutter developer. I can help develop a well-structured cross-platform app with smooth UI, progress tracking, and reliable backend integration, similar to mobile learning and content-based apps I've worked on previously that are attached and highlighted in my portfolio.

My Approach to this Project:
1. Set up the Flutter project with clean architecture, modular folder structure, and proper dependency management.
2. Implement authentication (email/password + Google/Apple) and onboarding flows with smooth UX.
3. Build the core dashboard, course listing, and lesson detail screens with responsive layouts.
4. Integrate Firebase services for authentication, database, storage, and push notifications.
5. Implement progress tracking and offline content storage for previously loaded lessons.
6. Test core logic and prepare the application for App Store and Play Store submission.

Estimated Timeline & cost: The MVP with the listed features can typically be completed within 6–8 weeks (total 250-300 hours) depending on UI complexity and content structure. My per hour rate is $25. So estimated cost of this project is $6000-$8000 (depending upon features, etc.) Let's discuss it over chat or schedule a meeting at your convenience.

Preferred State Management: I prefer Riverpod for apps like this because it provides clean dependency management, scalability for growing features (quizzes, subscriptions, AI modules later), and better testability compared to traditional provider patterns.

Availability: I can start immediately and dedicate 35-40 hours per week to the project.

Recommended Tech Stack:
- Flutter (latest stable)
- Firebase (Auth, Firestore, Storage, FCM)
- Riverpod or Bloc (state management)
- Hive / sqflite (offline storage)

Relevant apps:
1. Developed Chef Connect, WebApp designed to revolutionize online culinary engagement by combining recipe sharing, e-commerce, and community interaction in one unified platform.
https://www.upwork.com/freelancers/hamzashahbaz992?p=1978077869426774016

2. Developed Flippability, an iOS-based price comparison platform enabling smart shopping decisions and reselling opportunities across major retailers.
https://www.upwork.com/freelancers/hamzashahbaz992?p=1978801741199450112

3. Developed My License & Compliance, an iOS and Android-based legal management app that simplifies tracking, renewing, and organizing essential business documents.
https://www.upwork.com/freelancers/hamzashahbaz992?p=1978449535103193088

4. Developed Wind book, a community-driven iOS app that enables service providers to showcase their skills, display pricing, and accept instant bookings from local customers.
https://www.upwork.com/freelancers/hamzashahbaz992?p=1448951333483151360

One Question: Will the course content (lessons, images, text) be managed directly in Firebase, or are you planning to connect it later to a separate admin/content management system?

Regards,
Hamza

Hello,
Your education app MVP aligns very well with the type of Flutter apps I usually build. For this project, I would implement the app using Clean Architecture with Bloc. which keeps the code organized and makes it easy to extend later.
I am Naeem Ibrahim, a Mobile Application Developer with over 5 years of experience specializing in Flutter. I have strong expertise in state management using Provider, Riverpod, GetX and Bloc, and have developed multiple applications featuring authentication, Firestore integration, and push notifications. I am proficient in working with REST APIs, JSON parsing, and asynchronous programming. My expertise in Flutter enables me to create efficient, scalable, and visually appealing mobile solutions that meet modern development standards.
I am available full-time in the coming weeks and am fluent in English, with proven experience collaborating across time zones and working effectively with remote teams.

Here i am adding links of my projects for reference
- Smart Home App, OhmPlug:https://play.google.com/store/apps/details?id=com.ohm.plug
- Sports Analytics & Statistics, LiveFot (Android)
https://play.google.com/store/apps/details?id=com.livefot.live

Hello,

It's a great pleasure to connect!! 🤝

I have few queries regarding the project. But based on my initial understanding of the scope and the MVP features you described, I estimate the development timeline to be around 10–14 weeks.

I generally recommend Flutter for this kind of cross-platform education app because it provides a single, consistent codebase for both iOS and Android and excellent performance close to native apps.

I am currently available and can start the project immediately. I can dedicate up to 40 hours per week to ensure steady progress and timely delivery.

Excellent performance close to native apps

Hey,

https://apps.apple.com/us/app/jolii-ai-language-learning/id6740603058 - that's my latest Flutter education app. AI-powered English learning with video streaming, live translation, and progress tracking. Published on both App Store and Google Play.

I also built this: http://kidnation.com - an AI-powered edutainment app co-founded by Chris Ludacris Bridges. Streaming content, interactive games, admin panel, Firebase backend. I rebuilt it from scratch after the previous team left an unscalable mess. Added the mobile app as a profile highlight.

Both apps share a lot of DNA with what you're building - structured content, progress tracking, Firebase, clean UI across phones and tablets.
For state management on a project like this, I'd go with Riverpod. It is the most cost-effective solution at the moment, and I have quite a few templates I can reuse with this stack.

Rough estimate: 10-12 weeks for the MVP you described. Fixed price - happy to share a number after a 20-min call where I can review your Figma files.
I'm available immediately and can commit 40 hrs/week.

Message me via Upwork and let's schedule a call to discuss more details :)
Best,
Roman

P.S. I added two more apps as profile highlights - check the UI quality before we talk. Shoot me a message and let's kick off.

You can see my app development Process on the attachment!

Hey there,

As a Top-Rated Mobile App Developer with over six years of hands-on experience, **I guarantee the delivery of a seamless**, **high-quality app and website that brings your vision to life**. Creating a modern, cross-platform education app that's both engaging and scalable is exactly the kind of project I specialize in. I've built Flutter apps with structured learning content, progress tracking, offline support, and polished UI/UX, so I can deliver an MVP that's stable, maintainable, and ready for future enhancements.

I invite you to peruse my portfolio of past projects to see the breadth and depth of my experience:
- https://play.google.com/store/apps/details?id=com.caretutors&hl=en
- https://play.google.com/store/apps/details?id=com.dhakatutors.myapp
- https://apps.apple.com/us/app/best-tutor/id6756836848

Technology use:
- Design UI/UX for mobile application and admin panel: Figma.
- Mobile app frontend development: Flutter/React JS
- Admin panel dashboard frontend development: React JS
- Backend development: Node.js, Express JS
- Payment Integration: Stripe
- Q/A Testing and Publishing on the Google Play Store and App Store.

If you're looking for a trusted partner to bring your ambitious app projects to life, let's connect. I'm excited to help you build something great. Reach out today, and let's start turning your vision into reality. Together, we can create something extraordinary.

Looking forward to hearing from you.

Cheers,
Ahad

Hello there, I have gone through your attached document and am ready to work on this project.

Based on my understanding, you want to develop a cross-platform education mobile app using Flutter for iOS and Android that allows users to access structured learning content, track their progress, and have a clean and engaging learning experience.

The MVP will include core features such as user authentication, onboarding, course and lesson viewing, progress tracking, offline content access, push notifications, and a scalable architecture so additional features can be added later.

I have worked on apps that include user authentication, Firebase integrations, learning modules, real-time features, and scalable architectures designed for future feature expansion. My focus is always on writing clean, maintainable code and building a strong foundation for long-term product growth.

For this project, I would approach the MVP with a structured architecture and a scalable development process. The core features you listed, authentication (email + Google/Apple), onboarding flow, course listings, lesson screens with rich content, progress tracking, offline content storage, push notifications, and a responsive UI, can all be implemented efficiently using Flutter with Firebase services.

Regarding availability, I can start immediately.

I would begin with:
1. Reviewing the user stories and designs
2. Setting up the project architecture and Firebase configuration
3. Implementing core modules such as authentication, onboarding, and the learning dashboard
4. Building the lesson system and progress tracking
5. Testing, optimization, and preparation for App Store and Play Store submission

I would be happy to discuss the project in more detail and review your designs or wireframes to finalize the development roadmap.

Looking forward to collaborating with you and helping bring this education platform to life.

Best regards,

Ajay

Good Day :) **Flutter architecture is at fingertips**. Education apps succeed when the learning flow feels simple, motivating, and distraction-free, so architecture and UX both matter from day one. Since the Flutter's launch, I have spent the last **6+ years building Flutter apps**, with Firebase backends, including apps with authentication, structured content, progress tracking, offline storage, and push notifications, so the MVP scope you outlined is very familiar.

For this type of learning platform I usually structure the app with MVVM/clean architecture , Riverpod or Bloc, separating UI, domain logic, and data layers so new features like quizzes, subscriptions, or AI explanations can be added easily later.
Firebase would handle Auth, Firestore content storage, FCM notifications, and analytics, while Hive/sqflite can support offline lesson caching.

An MVP with the features listed typically takes **8–10 weeks**, depending on design readiness. Details estimation & **PDF document** will be submitted upon connecting over Upwork message box.

We have successfully developed a custom Flutter-based mobile application and Learning Management System (LMS) for Al Siraat College (alsiraat.vic.edu.au) and CRICE (crice.co.za). The app delivers seamless cross-platform performance on iOS and Android, featuring intuitive course management, real-time student progress tracking, and interactive learning modules.

🔹 🔹 🔹 **You can verify credibility from Upwork client's feedback as valid evidence**.

◕‿◕ 🙋‍♂️ Hello team

I have carefully reviewed your project requirements for the mobile education app. With extensive experience in Flutter development and a strong track record of building user-friendly applications, I am well-equipped to deliver a robust MVP for your needs.

Here are some matching examples from my portfolio:
1. MyStudyTracker: Study Planner — NEET/JEE study planner and attendance tracker for Indian students.
https://play.google.com/store/apps/details?id=com.dobhai.mystudytracker
2. Study Fetch — AI-powered app that converts lectures and notes into flashcards and quizzes.
https://play.google.com/store/apps/details?id=com.studyfetch.mobile.v2
3. TalentLMS — Award-winning learning management system for delivering courses to employees and students.
https://play.google.com/store/apps/details?id=com.talentlms.android

Here are a few questions that will help me give you an accurate quote and timeline estimate:
1. What specific user authentication methods do you prefer to prioritize for the MVP?
2. Can you provide more details about the onboarding flow and the key elements you'd like to include in those screens?
3. Are there any particular design inspirations or guidelines you would like me to follow for the app's UI/UX?

Let's have a detailed discussion over the call if you liked my proposal.
Do you have availability at 11am your time today or tomorrow?

Thanks

Hi! 👋

Your project sounds like a great fit. I specialize in Flutter MVP development with clean architecture and scalable foundations, which is exactly what you're aiming for with this education app.

🎯How I would approach your MVP:

• Cross-platform Flutter app (iOS + Android) using the latest Flutter 3.x with responsive layouts for phones and tablets.
• Authentication system with Email/Password + Google and Apple Sign-In via Firebase Auth.
• Smooth onboarding flow (3–4 screens) with clean animations and clear UX.
• Home dashboard displaying learning progress, recommended lessons, and quick stats.
• Course / subject catalog using modern card/grid layouts for easy navigation.
• Lesson detail pages with rich text, images, and scalable support for embedded media (YouTube later).
• Progress tracking system (completed lessons + percentage per course).
• Offline support for downloaded lessons using Hive or sqflite.
• Settings screen with language selection, notifications toggle, and dark/light mode.
• Push notifications setup using Firebase Cloud Messaging.

🎯Here are some of my relevant projects:
🚀https://play.google.com/store/apps/details?id=app.gamblecount.android
Gamble Count - A supportive mobile application designed to assist individuals in overcoming gambling addiction by offering a comprehensive toolkit for recovery, including sobriety tracking and stress management exercises. I developed a visual dashboard to track key metrics like sobriety duration and money saved. I also implemented an interactive "Stress Relief" module utilizing Flutter Flame to provide immediate tactile distraction during cravings, ensuring seamless state management consistency via BLOC between the game loop and the app interface. Stack: Flutter, Dart, BLOC, Flutter Flame, Firebase (Auth, Firestore, Analytics, Crashlytics), RevenueCat, fl_chart, Shared Preferences, Flutter Local Notifications, GoRouter.

🚀https://make-me-birthday.com
MakeMebirthday - A personal finance and goal-setting application designed to encourage financial discipline through positive reinforcement and a "micro-goal" system. I developed a

cross-platform financial tracking app with a custom "Goal Engine" that allows users to set financial targets and automatically calculates the daily savings required to achieve them. I also architected a complex, timezone-aware notification system using Firebase Cloud Functions to deliver scheduled reminders without overloading the database.
Stack: Flutter, Dart, BLOC, Firebase (Auth, Firestore, Cloud Functions, Cloud Messaging, Analytics, Crashlytics), RevenueCat, Flutter Local Notifications, GoRouter.

My github:https://github.com/Masayoshl/my_anime_list

Let's discuss all this on a call, when you have a free slot?
Thank you 🙌
Andriy

Estimated Timeline for MVP
Approximately 8–10 weeks depending on final design readiness, content structure, and testing requirements.

Hi, I've reviewed the project summary and the document you shared. Before moving forward, I'd like to clarify a few points to ensure the architecture, development approach, and timeline are aligned correctly. I've attached my Upwork portfolio and some recent flutter projects for reference.

Queries:
- Do you already have the Figma designs or wireframes ready, or should part of the UI/UX be refined during development?
- Will the course content (lessons, images, media) be managed directly through Firebase/Firestore, or do you plan to use a separate CMS or admin panel?
- For offline support, should the app allow users to download lessons manually, or automatically cache previously opened content?
- Do you already have a Firebase project configured, or should it be set up as part of the development process?
- For push notifications, do you plan to send scheduled notifications (e.g., reminders, new lessons), or mainly event-based notifications?

Once these points are confirmed, I can finalize the architecture and development milestones for the MVP.

I'm a mobile app developer with strong experience building cross-platform applications using Flutter and React Native, including education, productivity, and business applications with authentication, progress tracking, offline data storage, and push notifications. My focus is on clean architecture, scalable code, and smooth user experience so that future features like quizzes, subscriptions, or AI learning tools can be added easily.

I'd be happy to review the designs and detailed requirements and help define a clear development roadmap with milestones to ensure the MVP is stable, scalable, and ready for store submission. I'm happy to discuss the project via chat or a quick call.

Looking forward to your response.

Best regards,

Danish

Your plan to build a clean, scalable Flutter-based education app MVP with structured learning content, progress tracking, and Firebase-powered infrastructure is exactly the type of mobile product we've helped launch before. For apps like this, the key is getting the architecture, content structure, and user experience right in the MVP so that future features like quizzes, subscriptions, and AI tools can be added without reworking the core system.

Based on your requirements, the main areas I would focus on are:
• Building a stable Flutter architecture using clean architecture principles to support future feature expansion
• Implementing Firebase integration (Auth, Firestore, Storage, FCM, Analytics) for scalable backend services
• Developing the learning flow including onboarding, dashboard, course listings, and lesson detail pages
• Creating progress tracking and structured learning state management so users can easily follow their progress
• Implementing offline support for downloaded lessons using Hive or a similar local database
• Delivering a modern, responsive UI that works smoothly across phones and tablets

Since you already plan Phase 2 features like quizzes, bookmarks, subscriptions, and AI integrations, the architecture will be structured so these modules can be added later without restructuring the app.

Here are a couple of projects from our portfolio:
AyurArmy Learning App
• https://apps.apple.com/in/app/ayurarmy-learning-app/id6745964372
• Portfolio: https://xpertlab.com/portfolio-item/ayur-army-flutter-app/

FRCRVIVACITY
• https://frcrvivacity.com/
• Portfolio: https://xpertlab.com/portfolio-item/frcr-vivacity-website/

A few quick points regarding your questions:
• Preferred state management: For this type of structured learning app, I would recommend Riverpod or Bloc because they scale well with modular architectures and make testing easier as the app grows.

• Availability: We can dedicate 40 hours per week and start immediately after requirements confirmation.
• Development workflow: GitHub repository, milestone-based delivery, and regular updates with screenshots or short videos.

A couple of quick questions that will help finalize the architecture:
• Will the lesson content (text, images, videos) be managed directly in Firebase/Firestore, or are you planning a separate CMS/admin panel later?
• Do you already have Figma designs ready, or should we initially work from wireframes/mood boards?

If helpful, we can also schedule a quick call to review the MVP scope and map out the development milestones so the app moves smoothly toward App Store and Play Store submission.

Looking forward to learning more about your project.

Regards,
Maherin

I have reviewed the attached document and you will be glad to know that I have already worked on many educational and learning platform that helps students track progress and stay motivated. The MVP will allows users to access structured learning content, track their progress, and stay engaged through a simple dashboard, lessons, and notifications. The app will include authentication, onboarding, course listings, lesson pages with rich content, progress tracking, offline access, and Firebase integration.
For this project I will use Flutter with the latest stable version to build a high-performance cross-platform app for both iOS and Android.
For the backend, I will use Firebase because it provides reliable and scalable services for mobile apps. I will implement Firebase Authentication for secure login with emil, Gogle, and Apple sign-in. Firestore will be used to store structured data like courses, lessons, and user progress. Firebase Storage will handle media files such as images or lesson resources. I will also integrate Firebase Cloud Messaging (FCM) for push notifications and Firebase Analytics to track user activity and engagement within the app. This setup ensures a secure, scalable, and easy-to-maintain backend.

Ni Hao-- Student application: Where they log in, take the subscription from multiple available course categories and get a link to the online available teachers, there are multiple filters for concise search, the teacher profile shows the video lectures uploaded for free with video call directly. The student selects the lessons preferences and joins the schedule for that class

Here is what I bring to your project
🔷 **Bloc architecture** : predictable state, clean layers, scales easily into Phase 2 without rework.
🔷 **Firebase end to end** : Auth, Firestore, FCM, Analytics, all production ready from day one.
🔷 **Offline first** : Hive caching with smart sync so learners never feel connectivity friction.
🔷 **Store ready delivery** : icons, splash, permissions, and full App Store and Play Store submission handled, not handed off to you.

I can begin within 2 days. For the MVP scope you described, I estimate 8 to 10 weeks across 4 milestones. Shall we set up a short call this week to align on Figma files and kick things off?

Best Regards,
Daxesh

P.**S**. You posted this role just yesterday and have not interviewed anyone yet, which tells me you are reading carefully. I respect that. Happy to walk through my exact milestone plan and answer your technical checklist in detail whenever you are ready.

Hi there,

I'm available for this. An education MVP with clean architecture, Firebase and offline support is a well scoped project and the feature list maps directly onto things I have built before. I do have a quick question, do you have Figma designs ready or are you starting from a mood board?

To answer your questions directly, the most relevant apps I have built are Coach Theory at apps.apple.com/al/app/coach-theory/id6446066438 is a Flutter app I built with user auth including Google and Apple sign in, onboarding flow, session booking, budget selection, coach matching and a dashboard, which covers most of the core screens you are building here. and Chaser the Network at play.google.com/store/apps/details?id=com.billowing_hill_37821, a social platform with active users built on Firebase auth, real time feeds and a polished Flutter UI. I also built Deep Sleep Sounds and Tracker, a wellness app with structured audio content, progress tracking and offline support which is very close to what you are building in terms of content delivery and progress architecture.

For state management I would go with Bloc because it keeps business logic cleanly separated from UI, scales well as features grow and is easy for any developer to pick up later, which matters a lot for a foundation you plan to build on.

For timeline and price I am proposing $5,500 fixed across 4 milestones over 8 to 10 weeks. The feature list here is genuinely comprehensive, full Firebase integration across auth, Firestore, Storage, FCM and Analytics, offline support, tablet responsiveness, social login, rich lesson screens and store submission for both platforms.
Estimated $5,500 to $7,000 is a realistic number that lets me deliver this properly without cutting corners on architecture or test coverage.

I can start this week and dedicate 20 to 30 hours per week consistently throughout the project.

Drop me a message and let's get moving.

Thank you,
Anser Manzer

Hey team, I completely understand from your description that you want to build a cross-platform education mobile app using Flutter that delivers structured lessons, tracks student progress, and provides a clean, engaging learning experience across iOS and Android.

I would build the MVP using Flutter 3 with clean architecture, Firebase backend services, and structured state management (Bloc or Riverpod) to ensure the app remains scalable for future features like quizzes, AI tutoring, and subscriptions.

I've worked on mobile learning and content-driven applications where user progress tracking, lesson delivery, and responsive UI were key to engagement.

→ Build Flutter app architecture with scalable folder structure and dependency injection
→ Implement authentication (email/password + Google/Apple)
→ Develop onboarding flow, dashboard, and course/lesson modules
→ Integrate Firebase (Auth, Firestore, Storage, FCM notifications)
→ Implement progress tracking and lesson completion analytics
→ Add offline lesson access using Hive or sqflite caching
→ Ensure clean UI/UX aligned with Material 3 and responsive layouts
→ Prepare builds for App Store and Play Store submission

I recommend Riverpod or Bloc for state management, as both provide predictable state handling and maintainable codebases for apps that grow beyond MVP stages.

If it sounds good, I'd be happy to jump on a call and review the Figma designs and user stories so we can finalize the MVP architecture and milestones.

Best,
Shibbal

Hi there,

We checked the document you shared about the Flutter education app MVP.

The scope is quite clear. Structured learning content, progress tracking, offline lessons, Firebase backend. A clean MVP that can grow later with quizzes, subscriptions, and AI features. That approach makes sense.

For this kind of learning app the key is keeping the architecture simple but scalable. Flutter + Firebase works well for that. I would typically structure it with a clear separation between UI, state management, and data layers so new modules like quizzes or subscriptions can be added without refactoring the core.

A couple of relevant apps we've worked on:

1. Educate – Online Teaching App (AI-powered teaching & test creation)
https://play.google.com/store/apps/details?id=com.educate.theteachingapp
https://apps.apple.com/us/app/educate-online-teaching-app/id1643531047

2. Eddmon (Tutor & Student apps) – two-sided tutoring platform with AI-assisted coaching and personalized learning guidance
https://play.google.com/store/apps/details?id=com.eddmon&hl=en_IN
https://play.google.com/store/apps/details?id=com.eddmon_client&hl=en_IN

Both include learning content delivery, progress features, and scalable mobile architecture, which is very similar to what you're building.

For the MVP you described, a realistic estimate would be:

• Timeline: 8–12 weeks
• Budget: $10k–$12k

Note: This is a high-level estimate; a detailed sprint plan and refined quote will follow after our initial call.

We can also discuss the Phase 2 ideas you mentioned once the MVP foundation is in place.

For state management, we usually prefer Riverpod. It keeps dependencies explicit and makes testing easier as the product grows.

We can start immediately and dedicate around 30-40 hours per week during the development phase.

If available, could you share the detailed requirements and design references you mentioned?

Regards,
Snehal V.

🏆**Flutter Developer for Modern Education App**🏆
https://www.upwork.com/freelancers/~019d51d650d9700591

Dear Client,

Sure, I can build a modern, cross-platform education app for iOS and Android. With over 5 years of professional Flutter experience, I have developed and published multiple learning and productivity apps with clean architecture, scalable code, engaging user experiences. I specialize in Flutter 3.x, Firebase integration, modern UI/UX, which aligns perfectly with your MVP requirements.

Relevant Experience:

https://apps.apple.com/in/app/edurev/id1529835494
https://play.google.com/store/apps/details?id=com.edurev&hl=en_IN
https://www.flexsin.com/portfolio/industry/education-and-non-profit/
https://www.flexsin.com/portfolio/services/artificial-intelligence/

My Approach

✔**State Management:** Riverpod for clean separation, testability, scalable future features (quizzes, AI, subscriptions).
✔**Architecture:** Clean layered structure (UI, state, services, data) with dependency injection.
✔**Core Features:** Auth (email + Google/Apple), onboarding, dashboard, courses & lessons, progress tracking, offline support, push notifications, settings, responsive UI.
✔**Firebase:** Auth, Firestore/Realtime DB, Storage, FCM, Analytics.
✔**Testing:** Unit & widget tests (~40% coverage) for reliability.
✔**App Readiness:** App Store & Play Store preparation icons, splash, permissions, build configs.

Estimated Timeline & Budget:

Timeline: ~10–12 weeks for Phase 1 MVP (including testing & deployment)

Budget: $7K–$8K fixed for the MVP features listed.

Availability:
I can start immediately and dedicate **30–40 hours/week** for the next 2–3 months.

I am confident in delivering a polished, maintainable, scalable MVP that sets a strong foundation for future phases, including quizzes, AI features, subscription integration.

I would love to discuss your requirements in detail and outline the development milestones.

Looking forward to collaborating!

Best regards,
Amit

NexusLink Services
Agency

Hello there,
Hope you are doing great!

I came across your project for building a cross-platform education app and it aligns very well with the type of mobile platforms we build at NexusLink Services. We specialize in developing scalable Flutter applications with clean architecture, strong UI/UX, and solid Firebase integration — exactly what you're looking for in this MVP phase.

About Us – NexusLink Services
NexusLink Services is a software development agency with experienced Flutter, React Native, and full-stack engineers. We have helped startups and growing companies build production-ready mobile apps with clean architecture so they can scale easily in later phases.

We particularly like that you are focusing on code quality, architecture, and a solid foundation rather than just a quick MVP. That is exactly how we approach projects as well.

Recently we have developed the similar concept app for one of our US client where we have integrated the similar features.
https://www.figma.com/design/CaiJpaNzfNLPlyp50qFN2q/JenLMS?node-id=0-1&p=f

Our general mobile app portfolio: https://portfolio.nexuslinkservices.com/mobile-apps

Rough MVP Estimate based on your description:
Timeline: 8 – 10 weeks
Estimated Effort: ~350 – 420 hours

Availability: We can start immediately and dedicate 20–30 hours per week to your project.

We prefer Riverpod for this kind of app.
Riverpod provides clean architecture, built-in dependency injection, and better performance because widgets only rebuild when needed. It also makes Firebase integration, offline caching, and testing much easier, which is important for scalable apps like an education platform with progress tracking and multiple data sources.

We can start immediately after project confirmation. Our team can dedicate up to 40 hours per week to this project, ensuring consistent progress and timely delivery of milestones.

Looking forward to discussing your project and helping you build a polished education platform.

Best regards,
Nilesh Dhorajiya

Hello! Your project reminded me of one project that I have developed https://www.lingq.com/en/ LingQ is a structured learning app where users learn through lessons, reading content, and progress tracking.

Features:
• Lessons organized into courses and topics
• Progress tracking across lessons
• Personalized recommendations
• Rich text lessons with audio and vocabulary
• Offline learning support

LingQ focuses on structured learning with reading based lessons and tracking progress across courses. Its a flexible self paced learning. How do you currently plan to structure the course content in the backend? For example, courses → modules → lessons, or a different hierarchy?

For this MVP, I would approach the app as a content-driven learning platform with structured state management and offline capability. Flutter is an excellent choice for this because we can maintain a single codebase while still delivering native-level performance on both iOS and Android. The first step would be establishing a clear architecture layer separating UI, business logic, and data services. This keeps the project maintainable as features grow. I usually implement this using Clean Architecture with Riverpod for state management, because it provides strong dependency control, easy testing, and predictable state updates without excessive boilerplate.

You can have a look at my portfolio:
https://my-clique.com/ / https://apps.apple.com/pk/app/myclique/id6447910443
https://liberdat.io/ / https://apps.apple.com/nl/app/liberdat/id6463052903
https://www.volatia.com/ / https://apps.apple.com/us/app/volatia/id1524856614
https://vidivet.com/ / https://apps.apple.com/gb/app/vidivet/id1549843089

The authentication system would be built using Firebase Authentication, supporting email/password along with Google and Apple sign-in. In terms of timeline, an MVP with the features listed can realistically be delivered in 6 to 8 weeks, depending on design readiness and feedback cycles.

A rough fixed price estimate for the MVP would fall in the $7,000 to $10,000 range, though I prefer confirming this after reviewing the wireframes and content structure. I can start immediately and dedicate 20 to 25 hours per week to ensure steady progress.

Let’s get on quick call to discuss the project further in detail. What time suits you the best? Best Regards
Abdul

Hi,

We read through the requirements and understand this is a cross platform education app where learners sign in securely, go through quick onboarding, see a dashboard with their progress and suggestions, browse subjects in categories, open lessons with text images and media that load smoothly, track what they complete, access some content offline, adjust settings like themes, and get push reminders to keep coming back. In daily use, a student would open the app on their phone or tablet, pick up where they left off on a lesson, see progress update right away, and feel motivated by quick stats without any confusing delays or sync issues.

Here is how the user journey we are thinking might look:

1. New user signs up with email or social login and completes simple onboarding screens.
2. User lands on dashboard showing progress bars, recommended subjects, and stats.
3. User browses catalog, selects a course, and opens a lesson with rich content.
4. User reads through, marks as done, and sees progress update across the app.
5. User gets a push notification later for new content or unfinished reminders.

Let us know whether we are on the right track.

I am Santanu, and we are a team that has worked on products such as educational platforms and interactive learning applications. We are prepared to manage all aspects, from development, including front end and back end work, to server setup and launching the app on Google Play and the App Store. We will provide post development support and maintenance. We have worked on similar projects. We are sharing the links for your review.

We are sharing the links for your review.

1. AI Based Language Learning App with gamification and Voice Recognition:
https://apps.apple.com/in/app/mothers-tongue-with-the-trio/id6478108173
https://play.google.com/store/apps/details?id=com.mt.pt

This app delivers interactive language lessons with progress tracking, daily goals, gamified elements, and voice practice. Our team developed the full cross platform mobile app including

structured content delivery, user onboarding, dashboard stats, offline mode for lessons, and push notifications to boost retention. That experience directly applies to your education MVP with its focus on engaging learning flows and reliable progress syncing.

2. On Demand Tutoring and AI Learning App:
https://play.google.com/store/apps/details?id=com.tutorocean&hl=en&gl=US
https://apps.apple.com/us/app/tutorocean/id1480876532?platform=iphone

This app connects students to tutors with real time sessions, AI explanations, progress reports, and content libraries. We built the complete application covering authentication, subject browsing, lesson views with media, tracking completion, and settings for personalization. The structured learning and dashboard elements relate well to building a scalable education platform like yours.

QUESTIONS/CLARIFICATIONS:

- How should progress tracking update across devices, for example real time sync when online or batch updates on login?
- What content types need priority in lessons, for example mostly text and images or more embedded videos and how to handle them offline?
- How customizable should the dashboard be, for example fixed recommendations or user adjustable based on preferences?
- Elaborate on notification triggers, for example daily reminders only or also based on progress milestones?
- What depth of offline support do you want in MVP, only auto cached opened lessons or manual download per lesson or course?

Rough timeline for MVP: around 10 to 12 weeks based on the listed features.

Estimated budget: roughly $8000 to $12000, depending on final details.

We prefer Riverpod for state management because it offers lightweight dependency injection, easy testing, and reactive updates without boilerplate, which keeps the code clean for an app with dynamic progress and recommendations.

We can start from this week and dedicate 25-30 hours per week on average.

The cost and timeline will depend on some key choices around content syncing, offline depth, and dashboard logic. It would help to discuss those points together in a quick 30 minute call before we prepare the estimate and timeline.

Regards,
Santanu

Hello, I have 4+ years of Flutter experience building scalable cross-platform apps using Flutter.

I have developed learning and productivity apps with Firebase Auth, Firestore, FCM, offline storage (Hive/sqflite), and clean architecture using Riverpod/Bloc.

Check my portfolio

LoopChat
https://play.google.com/store/apps/details?id=com.loopchat.live
https://apps.apple.com/in/app/loopchat-live/id6741800683

Mindorra
https://play.google.com/store/apps/details?id=com.mindorra.video.chat

I focus on smooth UI, structured code, and MVPs built for future scalability.

I can deliver the MVP in ~6-8 weeks, milestone-based, with regular updates via GitHub and Loom.

I can start immediately for 20+ hours/week.

Thanks & Regards,
Namra.
